About the IEC

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

About IEC publications

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigenda or an amendment might have been published.

- Catalogue of IEC publications: www.iec.ch/searchpub

The IEC on-line Catalogue enables you to search by a variety of criteria (reference number, text, technical committee,...). It also gives information on projects, withdrawn and replaced publications.

- IEC Just Published: www.iec.ch/online_news/justpub

Stay up to date on all new IEC publications. Just Published details twice a month all new publications released. Available on-line and also by email.

- Electropedia: www.electropedia.org

The world's leading online dictionary of electronic and electrical terms containing more than 20 000 terms and definitions in English and French, with equivalent terms in additional languages. Also known as the International Electrotechnical Vocabulary online.

- Customer Service Centre: www.iec.ch/webstore/custserv

FOREWORD.....	10
INTRODUCTION.....	11
General	11
SCSI standards family.....	11
1 Scope.....	12
2 Normative references.....	13
3 Terms, definitions, symbols, abbreviations, and conventions	13
3.1 Terms and definitions	13
3.2 Acronyms.....	25
3.3 Keywords.....	25
3.4 Editorial conventions	26
3.5 Numeric conventions	27
3.6 Notation conventions	28
3.6.1 UML notation conventions	28
3.6.1.1 Notation conventions overview.....	28
3.6.1.2 Constraint and note conventions.....	28
3.6.1.3 Class diagram conventions	29
3.6.1.4 Object diagram conventions.....	33
3.6.2 Notation for procedure calls.....	34
3.6.3 Notation for state diagrams.....	34
4 SCSI architecture model	36
4.1 Introduction.....	36
4.2 Compliance Requirements	36
4.3 The SCSI distributed service model	37
4.4 The SCSI client-server model.....	38
4.4.1 SCSI client-server model overview	38
4.4.2 Synchronizing client and server states	39
4.4.3 Request/Response ordering	39
4.5 The SCSI structural model	39
4.6 SCSI classes	41
4.6.1 SCSI classes overview	41
4.6.2 SCSI Domain class.....	41
4.6.3 Service Delivery Subsystem class.....	42
4.6.4 SCSI Device class	43
4.6.4.1 SCSI Device class overview.....	43
4.6.4.2 SCSI Device Name attribute	43
4.6.5 SCSI Port class.....	44
4.6.5.1 SCSI Port class overview	44
4.6.5.2 Relative Port Identifier attribute	45
4.6.6 SCSI Target Port class	45
4.6.6.1 SCSI Target Port class overview.....	45
4.6.6.2 Target Port Identifier attribute.....	45
4.6.6.3 Target Port Name attribute.....	45
4.6.7 SCSI Initiator Port class.....	46
4.6.7.1 SCSI Initiator Port class overview	46
4.6.7.2 Initiator Port Identifier attribute	46
4.6.7.3 Initiator Port Name attribute	46
4.6.8 Task Router class	46
4.6.9 SCSI Initiator Device class.....	47
4.6.10 Application Client class	47
4.6.11 Application Client Task Management Function class	48
4.6.11.1 Application Client Task Management Function class overview.....	48
4.6.11.2 Function Identifier attribute.....	48
4.6.11.3 Nexus attribute	48
4.6.11.4 Service Response attribute	48

4.6.11.5 Additional Response Information attribute	48
4.6.12 Application Client Task Set class	48
4.6.13 Application Client Command class	49
4.6.13.1 Application Client Command class overview	49
4.6.13.2 I_T_L_Q Nexus attribute	49
4.6.13.3 CDB attribute	49
4.6.13.4 Task Attribute attribute	49
4.6.13.5 Status attribute	49
4.6.13.6 Service Response attribute	49
4.6.13.7 Data-In Buffer attribute	49
4.6.13.8 Data-In Buffer Size attribute	49
4.6.13.9 Data-Out Buffer attribute	49
4.6.13.10 Data-Out Buffer size attribute	49
4.6.13.11 CRN attribute	49
4.6.13.12 Command Priority attribute	50
4.6.13.13 First Burst Enabled attribute	50
4.6.13.14 Sense Data attribute	50
4.6.13.15 Sense Data Length attribute	50
4.6.13.16 Status Qualifier attribute	50
4.6.14 SCSI Target Device class	50
4.6.15 Level 1 Hierarchical Logical Unit class	51
4.6.16 Level 2 Hierarchical Logical Unit class	52
4.6.17 Level 3 Hierarchical Logical Unit class	52
4.6.18 Level 4 Hierarchical Logical Unit class	53
4.6.19 Logical Unit class	53
4.6.19.1 Logical Unit class overview	53
4.6.19.2 LUN attribute	55
4.6.19.3 Logical Unit Name attribute	55
4.6.19.4 Dependent Logical Unit attribute	55
4.6.20 Device Server class	56
4.6.21 Task Manager class	56
4.6.22 Task Set class	56
4.6.23 Command class	56
4.6.23.1 Command class overview	56
4.6.23.2 I_T_L_Q Nexus attribute	56
4.6.23.3 Task Attribute attribute	56
4.6.23.4 CDB attribute	57
4.6.23.5 CRN attribute	57
4.6.23.6 Command Priority attribute	57
4.6.23.7 Status attribute	57
4.6.23.8 Sense Data attribute	57
4.6.23.9 Sense Data Length attribute	57
4.6.23.10 Service Response attribute	57
4.6.23.11 Status Qualifier attribute	57
4.6.23.12 First Burst Enabled attribute	57
4.6.23.13 Device Server Buffer attribute	57
4.6.23.14 Application Client Buffer Offset attribute	57
4.6.23.15 Request Byte Count attribute	57
4.6.23.16 Delivery Result attribute	58
4.6.24 Task Management Function class	58
4.6.24.1 Task Management Function class overview	58
4.6.24.2 Function Identifier attribute	58
4.6.24.3 Nexus attribute	58
4.6.24.4 Service Response attribute	58
4.6.24.5 Additional Response Information attribute	58
4.6.25 Well Known Logical Unit class	58
4.7 Logical unit number (LUN)	59
4.7.1 Introduction	59

4.7.2 Logical unit representation format.....	59
4.7.3 LUNs overview.....	59
4.7.4 Minimum LUN addressing requirements.....	59
4.7.5 Single level LUN structure	60
4.7.6 Eight byte LUN structure.....	62
4.7.7 Peripheral device addressing method.....	64
4.7.8 Flat space addressing method.....	65
4.7.9 Logical unit addressing method	66
4.7.10 Extended logical unit addressing	67
4.7.11 Well known logical unit addressing	70
4.7.12 Extended flat space addressing method.....	70
4.7.13 Logical unit not specified addressing	71
4.8 Nexus	71
4.8.1 Nexus overview.....	71
4.8.2 Command identifier.....	72
4.8.3 Nexus usage rules	72
4.9 SCSI ports	72
4.9.1 SCSI port configurations.....	72
4.9.2 SCSI devices with multiple ports.....	73
4.9.3 Multiple port SCSI target device structure	74
4.9.4 Multiple port SCSI initiator device structure	75
4.9.5 Multiple port SCSI device structure.....	76
4.9.6 SCSI initiator device view of a multiple port SCSI target device.....	77
4.9.7 SCSI target device view of a multiple port SCSI initiator device.....	79
4.10 The SCSI model for distributed communications	79
5 SCSI command model	84
5.1 The Execute Command procedure call	84
5.2 Command descriptor block (CDB).....	85
5.3 Status	86
5.3.1 Status codes	86
5.3.2 Status qualifier	87
5.3.3 Status precedence	89
5.4 SCSI transport protocol services in support of Execute Command.....	90
5.4.1 Overview	90
5.4.2 Command and status SCSI transport protocol services	90
5.4.2.1 Command and status SCSI transport protocol services overview	90
5.4.2.2 Send SCSI Command SCSI transport protocol service request	91
5.4.2.3 SCSI Command Received SCSI transport protocol service indication	91
5.4.2.4 Send Command Complete SCSI transport protocol service response	92
5.4.2.5 Command Complete Received SCSI transport protocol service confirmation	92
5.4.3 Data transfer SCSI transport protocol services.....	93
5.4.3.1 Introduction.....	93
5.4.3.2 Data-In delivery service.....	95
5.4.3.2.1 Send Data-In SCSI transport protocol service request.....	95
5.4.3.2.2 Data-In Delivered SCSI transport protocol service confirmation	95
5.4.3.3 Data-Out delivery service	95
5.4.3.3.1 Receive Data-Out SCSI transport protocol service request	95
5.4.3.3.2 Data-Out Received SCSI transport protocol service confirmation.....	96
5.4.3.4 Terminate Data Transfer service.....	96
5.4.3.4.1 Terminate Data Transfer SCSI transport protocol service request.....	96
5.4.3.4.2 Data Transfer Terminated SCSI transport protocol service confirmation	97
5.5 Command lifetimes.....	97
5.6 Aborting commands.....	98
5.7 Command processing example	103
5.8 Commands that complete with CHECK CONDITION status.....	103
5.8.1 Overview	103
5.8.2 Handling commands when ACA is not in effect.....	104
5.8.3 Aborting commands terminated with a CHECK CONDITION status without establishing an ACA	104

5.9 Auto contingent allegiance (ACA).....	105
5.9.1 ACA overview	105
5.9.2 Establishing an ACA	105
5.9.3 Handling new commands received on the faulted I_T nexus when ACA is in effect	106
5.9.4 Handling new commands received on non-faulted I_T nexuses when ACA is in effect	107
5.9.4.1 Command processing permitted for commands received on non-faulted I_T nexuses during ACA	107
5.9.4.2 Handling new commands received on non-faulted I_T nexuses when ACA is in effect.....	107
5.9.5 Clearing an ACA condition	108
5.10 Overlapped commands	109
5.11 Incorrect logical unit.....	109
5.12 Task attribute exception conditions	109
5.13 Sense data	110
5.14 Unit attention condition.....	110
6 SCSI events and event notification model	114
6.1 SCSI events overview	114
6.2 Establishing a unit attention condition subsequent to detection of an event	116
6.3 Conditions resulting from SCSI events.....	117
6.3.1 Power on.....	117
6.3.2 Hard reset	118
6.3.3 Logical unit reset.....	118
6.3.4 I_T nexus loss.....	118
6.3.5 Power loss expected.....	119
6.4 Event notification SCSI transport protocol services.....	119
7 Task management functions	121
7.1 Task management function procedure calls.....	121
7.2 ABORT TASK.....	122
7.3 ABORT TASK SET	123
7.4 CLEAR ACA	123
7.5 CLEAR TASK SET	123
7.6 I_T NEXUS RESET	124
7.7 LOGICAL UNIT RESET.....	124
7.8 QUERY TASK	124
7.9 QUERY TASK SET	125
7.10 QUERY ASYNCHRONOUS EVENT	125
7.11 Task management function lifetime.....	126
7.12 Task management SCSI transport protocol services	127
7.12.1 Task management SCSI transport protocol services overview	127
7.12.2 Send Task Management Request SCSI transport protocol service request.....	127
7.12.3 Task Management Request Received SCSI transport protocol service indication.....	128
7.12.4 Task Management Function Executed SCSI transport protocol service response.....	128
7.12.5 Received Task Management Function Executed SCSI transport protocol service confirmation ..	129
7.13 Task management function example.....	130
8 Task set management.....	131
8.1 Introduction to task set management	131
8.2 Implicit head of queue	131
8.3 Command management model	131
8.4 Command management events	132
8.5 Command states	132
8.5.1 Overview	132
8.5.1.1 Command state nomenclature	132
8.5.1.2 Suspended information	133
8.5.2 Enabled command state	133
8.5.3 Blocked command state.....	133
8.5.4 Dormant command state.....	133
8.5.5 Completed command state	133
8.5.6 Command states and command lifetimes.....	133
8.6 Task attributes.....	134

8.6.1 Overview	134
8.6.2 Commands having the SIMPLE task attribute	134
8.6.3 Commands having the ORDERED task attribute	135

INFORMATION TECHNOLOGY – SMALL COMPUTER SYSTEM INTERFACE (SCSI) –

Part 414: Architecture model-4 (SAM-4)

FOREWORD

- 1) ISO (International Organization for Standardization) and IEC (International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards. Their preparation is entrusted to technical committees; any ISO and IEC member body interested in the subject dealt with may participate in this preparatory work. International governmental and non-governmental organizations liaising with ISO and IEC also participate in this preparation.
- 2) In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75 % of the national bodies casting a vote.
- 3) The formal decisions or agreements of IEC and ISO on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC and ISO member bodies.
- 4) IEC, ISO and ISO/IEC publications have the form of recommendations for international use and are accepted by IEC and ISO member bodies in that sense. While all reasonable efforts are made to ensure that the technical content of IEC, ISO and ISO/IEC publications is accurate, IEC or ISO cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 5) In order to promote international uniformity, IEC and ISO member bodies undertake to apply IEC, ISO and ISO/IEC publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any ISO/IEC publication and the corresponding national or regional publication should be clearly indicated in the latter.
- 6) ISO and IEC provide no marking procedure to indicate their approval and cannot be rendered responsible for any equipment declared to be in conformity with an ISO/IEC publication.
- 7) All users should ensure that they have the latest edition of this publication.
- 8) No liability shall attach to IEC or ISO or its directors, employees, servants or agents including individual experts and members of their technical committees and IEC or ISO member bodies for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication of, use of, or reliance upon, this ISO/IEC publication or any other IEC, ISO or ISO/IEC publications.
- 9) Attention is drawn to the normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 10) Attention is drawn to the possibility that some of the elements of this International Standard may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

International Standard ISO/IEC 14776-414 was prepared by subcommittee 25: Interconnection of information technology equipment, of ISO/IEC joint technical committee 1: Information technology.

The list of all currently available parts of the ISO/IEC 14776 series, under the general title *Information technology – Small computer system interface (SCSI)*, can be found on the IEC web site.

This International Standard has been approved by vote of the member bodies and the voting results may be obtained from the address given on the second title page.

This publication has been drafted in accordance with the ISO/IEC Directives, Part 2.

INTRODUCTION

General

The set of SCSI (Small Computer System Interface) standards consists of this standard and the SCSI implementation standards (see SCSI Standards family). This standard defines a reference model that specifies common behaviors for SCSI devices, and an abstract structure that is generic to all SCSI I/O system implementations.

The set of SCSI standards specifies the interfaces, functions, and operations necessary to ensure interoperability between conforming SCSI implementations. This standard is a functional description. Conforming implementations may employ any design technique that does not violate interoperability.

The following concepts are obsolete:

- a) support for the SPI-5 SCSI transport protocol (see SAM-2);
- b) contingent allegiance (see SAM-2);
- c) the TARGET RESET task management function (see SAM-2);
- d) basic task management model (see SAM-3);
- e) untagged tasks (see SAM-2); and
- f) linked command function (see SAM-3).

SCSI standards family

Figure 1 shows the relationship of this standard to the other standards and related projects in the SCSI family of standards as of the publication of this standard.

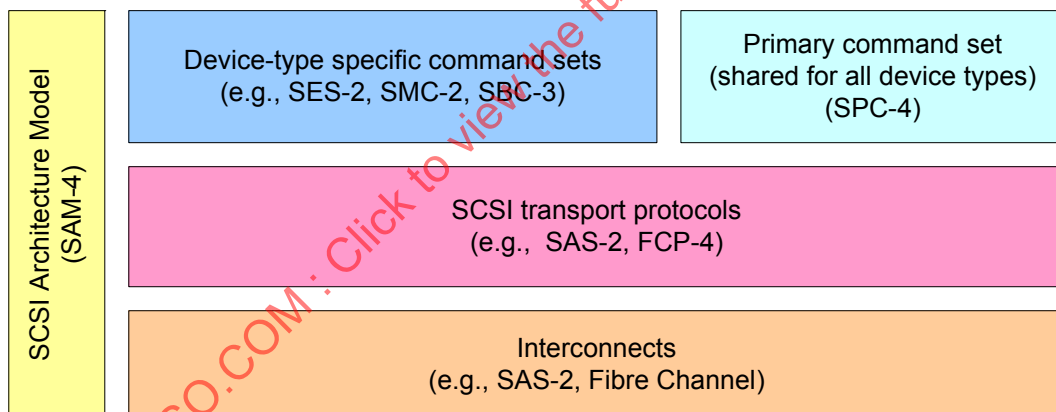

Figure 1 — SCSI standard structure

The SCSI standard structure in figure 1 is intended to show the general applicability of the standards to one another. Figure 1 is not intended to imply a relationship such as a hierarchy, protocol stack, or system architecture.

The functional areas identified in figure 1 characterize the scope of standards within a group as follows:

SCSI Architecture Model: Defines the SCSI systems model, the functional partitioning of the SCSI standard set and requirements applicable to all SCSI implementations and implementation standards.

Device-Type Specific Command Sets: Implementation standards that define specific device types including a device model for each device type. These standards specify the required commands and behaviors that are specific to a given device type and prescribe the requirements to be followed by a SCSI initiator device when sending commands to a SCSI target device having the specific device type. The commands and behaviors for a specific device type may include by reference commands and behaviors that are shared by all SCSI devices.

INFORMATION TECHNOLOGY – SMALL COMPUTER SYSTEM INTERFACE (SCSI) –

Part 414: Architecture model-4 (SAM-4)

1 Scope

This part of ISO/IEC 14776 defines a reference model that specifies common behaviors for SCSI devices and an abstract structure that is generic to all SCSI I/O system implementations.

This standard defines generic requirements that pertain to SCSI implementation standards. It also defines implementation requirements. An implementation requirement specifies behavior in terms of measurable or observable parameters that apply to an implementation. Examples of implementation requirements defined in this standard are the status values to be returned upon command completion and the service responses to be returned upon task management function completion.

Generic requirements are transformed to implementation requirements by an implementation standard. An example of a generic requirement is the hard reset behavior specified in 6.3.2.

2 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

The provisions of the referenced specifications other than ISO, IEC, ISO and ITU standards, as identified in this clause, are valid within the context of this International Standard. The reference to such a specification within this International Standard does not give it any further status within ISO or IEC. In particular, it does not give the referenced specification the status of an International Standard.

3 Terms, definitions, symbols, abbreviations, and conventions

3.1 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

3.1.1

ACA command

command with the ACA task attribute (see 3.1.8, and 8.6.5)

3.1.2

additional sense code

combination of the ADDITIONAL SENSE CODE field and the ADDITIONAL SENSE CODE QUALIFIER field in the sense data (see 3.1.112 and SPC-3)

3.1.3

aggregation

when referring to classes (see 3.1.13), a form of association that defines a whole-part relationship between the whole (i.e., aggregate) and its parts

3.1.4

application client

a class whose objects are, or an object that is, the source of commands and task management function requests (see 4.6.10)

3.1.5

argument

datum provided as input to or output from a procedure call (see 3.1.83)

3.1.6

association

when referring to classes (see 3.1.13), a relationship between two or more classes that specifies connections among their objects (i.e., a relationship that specifies that objects of one class are connected to objects of another class).

3.1.7

attribute

when referring to classes (see 3.1.13), a named property of a class that describes the range of values that the class or its objects may hold; when referring to objects (see 3.1.73), a named property of the object

3.1.8

auto contingent allegiance

task set condition established following the completion of a command with a CHECK CONDITION status when the NACA bit is set to one in the CONTROL byte (see 5.9)

3.1.9

background operation

operation started by a command that continues processing after the command is no longer in the task set (see 5.5)

3.1.10

blocked command state

state in which a command is prevented from completing due to an ACA condition (see 8.5.3)

3.1.11

blocking boundary

task set boundary denoting a set of conditions that inhibit commands outside the boundary from entering the enabled command state (see 8.9)

3.1.12

byte

8-bit construct

3.1.13

class

description of a set of objects that share the same attributes, operations, relationships (e.g., aggregation, association, generalization, and dependency), and semantics; classes may have attributes and may support operations

3.1.14**class diagram**

shows a set of classes and their relationships; class diagrams are used to illustrate the static design view of a system (see 3.6.1.3)

3.1.15**client-server**

relationship established between a pair of distributed entities where one (the client) requests the other (the server) to perform some operation or unit of work on the client's behalf (see 4.4)

3.1.16**client**

entity that requests a service from a server; this standard defines one client, the application client

3.1.17**command**

request describing a unit of work to be performed by a device server

3.1.18**command descriptor block**

structure used to communicate a command from an application client to a device server; a CDB may have a fixed length of 6 bytes, 10 bytes, 12 bytes, or 16 bytes, or a variable length of between 12 bytes and 260 bytes (see 5.2 and SPC-4)

3.1.19**command identifier**

the portion of an I_T_L_Q nexus (i.e., the Q) that is the numerical identifier of the command (see 3.1.17) within an I_T_L nexus (see 4.8.2)

3.1.20**command priority**

the relative scheduling importance of a command having the SIMPLE task attribute among the set of commands having the SIMPLE task attribute already in the task set (see 8.7)

3.1.21**command standard**

SCSI standard that defines the model, commands, and parameter data for a device type (e.g., SPC-4, SBC-3) (see clause 1)

3.1.22**completed command**

command that has completed with a service response of COMMAND COMPLETE

3.1.23**confirmation**

response returned to an application client or device server that signals the completion of a service request.

3.1.24**confirmed SCSI transport protocol service**

service available at the SCSI transport protocol service interface that includes a confirmation of completion (see 4.10)

3.1.25**constraint**

when referring to classes (see 3.1.13) and objects (see 3.1.73), a mechanism for specifying semantics or conditions that are maintained as true between entities (e.g., a required condition between associations)

3.1.26

current command

command that has a data transfer SCSI transport protocol service request in progress (see 5.4.3) or is in the process of sending command status; each SCSI transport protocol standard may define the SCSI transport protocol specific conditions under which a command is considered a current command

3.1.27

deferred error

error generated by a background operation (see SPC-4)

3.1.28

dependency

relationship between two elements in which a change to one element (e.g., the server) may affect or supply information needed by the other element (e.g., the client)

3.1.29

dependent logical unit

logical unit that is addressed via some other logical unit(s) in a hierarchical logical unit structure (see 3.1.44) and that is at a higher numbered level in the hierarchy than the referenced logical unit (see 4.6.19.4)

3.1.30

device model

the description of a type of SCSI target device (e.g., a block device or a stream device).

3.1.31

device server

class whose objects process, or an object that processes, commands according to the requirements for command management (see 4.6.20)

3.1.32

device service request

request submitted by an application client conveying a command to a device server

3.1.33

device service response

response returned to an application client by a device server on completion of a command

3.1.34

domain

I/O system consisting of a set of SCSI devices and a service delivery subsystem, where the SCSI devices interact with one another by means of the service delivery subsystem

3.1.35

dormant command state

state in which a command is prevented from entering the enabled command state (see 3.1.36) due to the presence of certain other commands in the task set (see 8.5.4)

3.1.36

enabled command state

state in which a command may complete at any time (see 8.5.2)

3.1.37

extended logical unit addressing

logical unit addressing method used by special function logical units (e.g., well known logical units) (see 4.7.10)

3.1.38**faulted I_T nexus**

I_T nexus on which a command terminated with a CHECK CONDITION status resulted in the establishment of an ACA. The faulted I_T nexus condition is cleared when the ACA condition is cleared

3.1.39**faulted task set**

task set that contains a faulting command; the faulted task set condition is cleared as soon as the ACA condition resulting from the CHECK CONDITION status is cleared

3.1.40**faulting command**

command that has terminated with a status of CHECK CONDITION that resulted in the establishment of an ACA (see 3.1.8)

3.1.41**field**

group of one or more contiguous bits, part of a larger structure (e.g., a CDB (see 3.1.18) or sense data (see 3.1.112))

3.1.42**generalization**

when referring to classes (see 3.1.13), a relationship among classes where one class (i.e., superclass) shares the attributes and operations on one or more classes (i.e., subclasses)

3.1.43**hard reset**

condition resulting from a power on condition or a reset event in which the SCSI device performs the hard reset operations described in 6.3.2, SPC-4, and the appropriate command standards

3.1.44**hierarchical logical unit**

inverted tree structure for forming and parsing LUNs (see 3.1.66) containing up to four addressable levels (see 4.6.15)

3.1.45**I_T nexus**

nexus between a SCSI initiator port and a SCSI target port (see 4.8)

3.1.46**I_T nexus loss**

condition resulting from a hard reset condition or an I_T nexus loss event in which the SCSI device performs the I_T nexus loss operations described in 6.3.4, SPC-4, and the appropriate command standards

3.1.47**I_T nexus loss event**

SCSI transport protocol specific event that results in an I_T nexus loss condition (see 6.3.4)

3.1.48**I_T_L nexus**

nexus between a SCSI initiator port, a SCSI target port, and a logical unit (see 4.8)

3.1.49**I_T_L_Q nexus**

nexus between a SCSI initiator port, a SCSI target port, a logical unit, and a command (see 4.8)

3.1.50

I_T_L_Q nexus transaction

information transferred between SCSI ports in a single data structure with defined boundaries (e.g., an information unit)

3.1.51

I_T_L_x nexus

either an I_T_L nexus or an I_T_L_Q nexus (see 4.8)

3.1.52

I/O operation

operation defined by a command or a task management function

3.1.53

implementation specific

requirement or feature that is defined in a SCSI standard but whose implementation may be specified by the system integrator or vendor

3.1.54

incorrect logical unit number

logical unit number of a logical unit that does not exist in the SCSI target device when addressed through a given I_T nexus

3.1.55

incorrect logical unit

logical unit that does not exist in the SCSI target device when addressed by a given I_T_L nexus

3.1.56

initiator port identifier

value by which a SCSI initiator port is referenced within a domain (see 4.6.7)

3.1.57

initiator port name

name (see 3.1.70) of a SCSI initiator port that is world wide unique within the SCSI transport protocol of the SCSI domain of that SCSI initiator port (see 4.6.5); the name may be made available to other SCSI devices or SCSI ports in that SCSI domain in SCSI transport protocol specific ways

3.1.58

instance

concrete manifestation of an abstraction to which a set of operations may be applied and which may have a state that stores the effects of the operation (e.g., an object is an instance of a class)

3.1.59

in transit

information that has been delivered to a service delivery subsystem for transmission, but not yet arrived at the intended recipient

3.1.60

implicit head of queue

optional processing model for specified commands wherein a command may be treated as if it had been received with a HEAD OF QUEUE task attribute (see 8.2)

3.1.61

layer

subdivision of the architecture constituted by SCSI initiator device and SCSI target device elements at the same level relative to the interconnect

3.1.62**link**

individual connection between two objects in an object diagram representing an instance of an association

3.1.63**logical unit** (see 4.6.19)

class whose objects implement, or an object that implements, a device model that manages and processes commands sent by an application client

3.1.64**logical unit inventory**

list of the LUNs reported by a REPORT LUNS command (see SPC-4)

3.1.65**logical unit name**

name (see 3.1.70) of a logical unit that is world wide unique within the SCSI transport protocol of a SCSI domain in which the SCSI device containing the logical unit has SCSI ports (see 4.6.4.2); the logical unit name may be made available to other SCSI devices or SCSI ports in SCSI transport protocol specific ways

3.1.66**logical unit number**

64-bit or 16-bit identifier for a logical unit (see 4.7)

3.1.67**logical unit reset**

condition resulting from a hard reset condition or a logical unit reset event in which the logical unit performs the logical unit reset operations described in 6.3.3, SPC-4, and the appropriate command standards

3.1.68**logical unit reset event**

event that results in a logical unit reset condition as described in 6.3.3

3.1.69**multiplicity**

when referring to classes (see 3.1.13), an indication of the range of allowable instances that a class or an attribute may have

3.1.70**name**

label of an object that is unique within a specified context and should never change

3.1.71**nexus**

relationship between two SCSI devices, and the SCSI initiator port and SCSI target port objects within those SCSI devices (see 4.8)

3.1.72**non-faulted I_T nexus**

I_T nexus that is not a faulted I_T nexus (see 3.1.38)

3.1.73**object**

entity with a well-defined boundary and identity that encapsulates state and behavior; all objects are instances of classes (see 3.1.58)

3.1.74

object diagram

shows a set of objects and their relationships at a point in time; object diagrams are used to illustrate static snapshots of instances of the things found in class diagrams (see 3.6.1.4)

3.1.75

operation

service that may be requested from any object of the class in order to effect behavior; operations describe what a class is allowed to do and may be a request or a query; a request may change the state of the object but a query should not

3.1.76

peer entities

entities within the same layer (see 3.1.61)

3.1.77

power cycle

power being removed from and later applied to a SCSI device

3.1.78

power loss expected

condition resulting from a power loss expected event in which the logical unit performs the power loss expected operations described in 6.3.5, SPC-4, and the appropriate transport protocol and command standards

3.1.79

power loss expected event

event that results in a power loss expected condition (see 6.3.5)

3.1.80

power on

condition resulting from a power on event in which the SCSI device performs the power on operations described in 6.3.1, SPC-4, and the appropriate command standards

3.1.81

power on event

power being applied to a SCSI device, resulting in a power on condition (see 6.3.1)

3.1.82

procedure

operation that is invoked through an external calling interface

3.1.83

procedure call

model used by this standard for the interfaces involving both the SAL (see 3.1.94) and STPL (see 3.1.105), having the appearance of a programming language function call (see 3.6.2)

3.1.84

protocol

specification and/or implementation of the requirements governing the content and exchange of information passed between distributed entities through a service delivery subsystem

3.1.85

queue

arrangement of commands within a task set (see 3.1.129)

3.1.86**receiver**

client or server that is the recipient of a service delivery transaction

3.1.87**reference model**

standard model used to specify system requirements in an implementation- independent manner

3.1.88**relative port identifier**

identifier for a SCSI port that is unique within a SCSI device (see 4.6.5.2)

3.1.89**request**

transaction invoking a service

3.1.90**request-response transaction**

interaction between a pair of distributed, cooperating entities, consisting of a request for service submitted to an entity followed by a response conveying the result

3.1.91**reset event**

SCSI transport protocol specific event that results in a hard reset condition as described in 6.3.2

3.1.92**response**

transaction conveying the result of a request

3.1.93**role**

when referring to classes (see 3.1.13) and objects (see 3.1.73), a label at the end of an association or aggregation that defines a relationship to the class on the other side of the association or aggregation

3.1.94**SCSI application layer**

the protocols and procedures that implement or issue commands and task management functions by using services provided by a STPL (see 3.1.105)

3.1.95**SCSI device**

class whose objects are, or an object that is, connected to a service delivery subsystem and supports a SCSI application protocol (see 4.6.4)

3.1.96**SCSI device name**

name (see 3.1.70) of a SCSI device that is world wide unique within the SCSI transport protocol of a SCSI domain in which the SCSI device has SCSI ports (see 4.6.4.2); the SCSI device name may be made available to other SCSI devices or SCSI ports in SCSI transport protocol specific ways

3.1.97**SCSI event**

condition defined by this standard (e.g., logical unit reset) that is detected by SCSI device and that requires notification of its occurrence within the SCSI device (see clause 6)

3.1.98

SCSI I/O system

I/O system, consisting of two or more SCSI devices, a SCSI interconnect and a SCSI transport protocol that collectively interact to perform SCSI I/O operations

3.1.99

SCSI initiator device

class whose objects originate, or an object that originates, device service and task management requests to be processed by a SCSI target device and receives device service and task management responses from SCSI target devices

3.1.100

SCSI initiator port

class whose objects act, or an object that acts, as the connection between application clients and a service delivery subsystem through which requests and confirmations are routed (see 4.6.7)

3.1.101

SCSI port

class whose objects connect, or an object that connects, the application client, device server or task manager to a service delivery subsystem through which requests, indications, responses, and confirmations are routed (see 4.6.5)

NOTE 5 SCSI port is synonymous with port.

3.1.102

SCSI port identifier

value by which a SCSI port is referenced within a domain; the SCSI port identifier is either an initiator port identifier (see 3.1.56) or a target port identifier (see 3.1.120)

3.1.103

SCSI target device

class whose objects receive, or an object that receives, device service and task management requests for processing and sends device service and task management responses to SCSI initiator devices (see 4.6.14)

3.1.104

SCSI target port

class whose objects act, or an object that acts, as the connection between device servers and task managers and a service delivery subsystem through which requests, indications, responses, and confirmations are routed (see 4.6.6)

3.1.105

SCSI transport protocol layer

protocol and services used by a SAL (see 3.1.94) to transport data representing a SCSI application protocol transaction

3.1.106

SCSI transport protocol service confirmation

procedure call from the STPL notifying the SAL that a SCSI transport protocol service request has completed

3.1.107

SCSI transport protocol service indication

procedure call from the STPL notifying the SAL that a SCSI transport protocol transaction has occurred

3.1.108

SCSI transport protocol service request

procedure call to the STPL to begin a SCSI transport protocol service transaction

3.1.109**SCSI transport protocol service response**

procedure call to the STPL containing a reply from the SAL in response to a SCSI transport protocol service indication

3.1.110**SCSI transport protocol specific**

implementation of the referenced item is defined by a SCSI transport protocol standard

3.1.111**sender**

client or server that originates a service delivery transaction

3.1.112**sense data**

data returned to an application client in the same I_T_L_Q nexus transaction (see 3.1.50) as a CHECK CONDITION status (see 5.13); fields in the sense data are referenced by name in this standard; see SPC-4 for a complete sense data format definition; sense data may also be retrieved using the REQUEST SENSE command (see SPC-4)

3.1.113**sense key**

SENSE KEY field in the sense data (see 3.1.112 and SPC-4)

3.1.114**server**

entity that performs a service on behalf of a client

3.1.115**service**

any operation or function performed by a SCSI object that is invoked by other SCSI objects

3.1.116**service delivery failure**

any non-recoverable error causing the corruption or loss of one or more service delivery transactions while in transit

3.1.117**service delivery subsystem**

class whose objects are, or an object that is, part of a SCSI I/O system that transmits service requests to a logical unit or SCSI target device and returns logical unit or SCSI target device responses to a SCSI initiator device (see 4.6.3)

3.1.118**service delivery transaction**

request or response sent through a service delivery subsystem

3.1.119**standard INQUIRY data**

data returned to an application client as a result of an INQUIRY command (see SPC-4) with the EVPD bit set to zero; fields in the standard INQUIRY data are referenced by name in this standard

3.1.120**target port identifier**

value by which a SCSI target port is referenced within a domain (see 4.6.6)

3.1.121

target port name

name (see 3.1.70) of a SCSI target port that is world wide unique within the SCSI transport protocol of the SCSI domain of that SCSI target port (see 4.6.5); the name may be made available to other SCSI devices or SCSI ports in that SCSI domain in SCSI transport protocol specific ways (see 4.6.6)

3.1.122

task

synonymous with command (see 3.1.17 and Annex C)

3.1.123

task attribute

attribute of a command (see 3.1.17) that specifies the processing relationship of a command with regard to other commands in the task set (see 3.1.129) (see 8.6)

3.1.124

task management function

task manager service capable of being requested by an application client to affect the processing of one or more commands (see clause 7)

3.1.125

task management request

request submitted by an application client, invoking a task management function to be processed by a task manager

3.1.126

task management response

response returned to an application client by a task manager on completion of a task management request

3.1.127

task manager

class whose objects control, or an object that controls the sequencing of commands and processes task management functions (see 4.6.21)

3.1.128

task router

class whose objects route, or an object that routes commands and task management functions between a service delivery subsystem (see 3.1.117) and the appropriate task manager(s) (see 4.6.8)

3.1.129

task set

class whose objects are, or an object that is, a group of commands within a logical unit, whose interaction is dependent on the task management (e.g., queuing) and ACA requirements (see 4.6.22)

3.1.130

transaction

cooperative interaction between two entities, involving the exchange of information or the processing of some request by one entity on behalf of the other

3.1.131

unconfirmed SCSI transport protocol service

service available at the SCSI transport protocol service interface that does not result in a completion confirmation (see 4.10)

3.1.132**well known logical unit**

class whose objects are each, or an object that is, a logical unit that only performs specific functions; well known logical units allow an application client to issue requests to receive and manage specific information relating to a SCSI target device (see 4.6.25)

3.1.133**well known logical unit number**

LUN that identifies a well known logical unit (see 4.7.11)

3.2 Acronyms

ACA	Auto Contingent Allegiance (see 3.1.8)
ADC-2	Automation/Drive Interface - Commands - 2
ADT-2	Automation/Drive Interface Transport Protocol - 2
CDB	Command Descriptor Block (see 3.1.18)
CRN	Command Reference Number
FCP-4	SCSI Fibre Channel Protocol - 4
iSCSI	Internet SCSI (see RFC 3720, http://www.ietf.org/rfc/rfc3720.txt)
ISO	Organization for International Standards
LUN	Logical Unit Number (see 3.1.66)
n/a	Not Applicable
RAID	Redundant Array of Independent Disks
SAL	SCSI application layer (see 3.1.94)
SAS-2	Serial Attached SCSI - 2
SAM-2	SCSI Architecture Model - 2
SAM-3	SCSI Architecture Model - 3
SBC-3	SCSI Block Commands - 3
SBP-3	Serial Bus Protocol - 3
SCSI	The architecture defined by the SCSI family of standards
SPC-4	SCSI Primary Commands - 3
SRP	SCSI RDMA Protocol
STPL	SCSI transport protocol layer (see 3.1.105)
VPD	Vital Product Data (see SPC - 4)
W-LUN	Well known logical unit number (see 3.1.133)
UML	Unified Modeling Language

3.3 Keywords**3.3.1****invalid**

keyword used to describe an illegal or unsupported bit, byte, word, field or code value; receipt by a device server of an invalid bit, byte, word, field or code value shall be reported as error

3.3.2**mandatory**

keyword indicating an item that is required to be implemented as defined in this standard

3.3.3**may**

keyword that indicates flexibility of choice with no implied preference; may is synonymous with the phrase "may or may not"

3.3.4

may not

keyword that indicates flexibility of choice with no implied preference; may not is synonymous with the phrase "may or may not"

3.3.5

obsolete

keyword indicating that an item was defined in prior SCSI standards but has been removed from this standard

3.3.6

option, optional

keywords that describe features that are not required to be implemented by this standard; however, if any optional feature defined by this standard is implemented, then it shall be implemented as defined in this standard

3.3.7

prohibited

keyword used to describe a feature, function, or coded value that is defined in a non-SCSI standard (i.e., a standard that is not a member of the SCSI family of standards) to which this standard makes a normative reference where the use of said feature, function, or coded value is not allowed for implementations of this standard

3.3.8

reserved

keyword referring to bits, bytes, words, fields, and code values that are set aside for future standardization; a reserved bit, byte, word, or field shall be set to zero, or in accordance with a future extension to this standard; recipients are not required to check reserved bits, bytes, words, or fields for zero values; receipt of reserved code values in defined fields shall be reported as an error

3.3.9

shall

keyword indicating a mandatory requirement; designers are required to implement all such mandatory requirements to ensure interoperability with other products that conform to this standard

3.3.10

should

keyword indicating flexibility of choice with a strongly preferred alternative; equivalent to the phrase "it is strongly recommended"

3.3.11

vendor specific

specification of the referenced item is determined by the SCSI device vendor

3.4 Editorial conventions

Certain words and terms used in this standard have a specific meaning beyond the normal English meaning. These words and terms are defined either in the glossary or in the text where they first appear.

Upper case is used when referring to the name of a numeric value defined in this specification or a formal attribute possessed by an entity. When necessary for clarity, names of objects, procedure calls, arguments or discrete states are capitalized or set in bold type. Names of fields are identified using small capital letters (e.g., NACA bit).

Names of procedure calls are identified by a name in bold type, such as **Execute Command** (see clause 5). Names of arguments are denoted by capitalizing each word in the name. For instance, Sense Data is the name of an argument in the **Execute Command** procedure call.

Quantities having a defined numeric value are identified by large capital letters. CHECK CONDITION, for example, refers to the numeric quantity defined in table 33 (see 5.3.1). Quantities having a discrete but unspecified value are identified using small capital letters. As an example, COMMAND COMPLETE, indicates a quantity returned by the **Execute Command** procedure call (see clause 5). Such quantities are associated with an event or indication whose observable behavior or value is specific to a given implementation standard.

Lists sequenced by lowercase or uppercase letters show no ordering relationship between the listed items.

EXAMPLE 1 The following list shows no relationship between the colors named:

- a) red, specifically on e of the following colors:
 - A) crimson; or
 - B) amber;
- b) blue; or
- c) green.

Lists sequenced by numbers show an ordering relationship between the listed items.

EXAMPLE 2 The following list shows a relationship between the colors named:

- 1) top
- 2) middle; and
- 3) bottom.

If a conflict arises between text, tables, or figures, the order of precedence to resolve the conflicts is text; then tables; and finally figures. Not all tables or figures are fully described in the text. Tables show data format and values.

Notes do not constitute any requirements for implementors and notes are numbered consecutively throughout this standard.

3.5 Numeric conventions

A binary number is represented in this standard by any sequence of digits consisting of only the Western-Arabic numerals 0 and 1 immediately followed by a lower-case b (e.g., 0101b). Underscores or spaces may be included in binary number representations to increase readability or delineate field boundaries (e.g., 0 0101 1010b or 0_0101_1010b).

A hexadecimal number is represented in this standard by any sequence of digits consisting of only the Western-Arabic numerals 0 through 9 and/or the upper-case English letters A through F immediately followed by a lower-case h (e.g., FA23h). Underscores or spaces may be included in hexadecimal number representations to increase readability or delineate field boundaries (e.g., B FD8C FA23h or B_FD8C_FA23h).

A decimal number is represented in this standard by any sequence of digits consisting of only the Western-Arabic numerals 0 through 9 not immediately followed by a lower-case b or lower-case h (e.g., 25).

This standard uses the following conventions for representing decimal numbers:

- a) the decimal separator (i.e., separating the integer and fractional portions of the number) is a period;
- b) the thousands separator (i.e., separating groups of three digits in a portion of the number) is a space;
- c) the thousands separator is used in both the integer portion and the fraction portion of a number; and
- d) the decimal representation for a year is 1999 not 1 999.

Table 1 shows some examples of decimal numbers using various conventions.

Table 1 — Numbering conventions

French	English	This standard
0,6	0.6	0.6
3,141 592 65	3.14159265	3.141 592 65
1 000	1,000	1 000
1 323 462,95	1,323,462.95	1 323 462.95

3.6 Notation conventions

3.6.1 UML notation conventions

3.6.1.1 Notation conventions overview

This standard uses class diagrams and object diagrams with notation that is based on the Unified Modeling Language (UML).

See 3.6.1.3 for the conventions used for class diagrams.

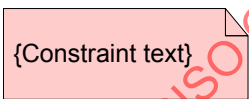

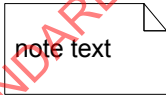

See 3.6.1.4 for the conventions used for object diagrams.

3.6.1.2 Constraint and note conventions

Class diagrams and object diagrams may include constraints, which specify requirements, and notes, which are informative.

Table 2 shows the notation used for constraints and notes.

Table 2 — Constraint and note notation

Notation	Description
	The presence of the curly brackets (i.e. {}) defines a constraint that is a normative requirement. An example of a constraint is shown in figure 3.
	The absence of curly brackets defines a note that is informative. An example of a note is shown in figure 4.

3.6.1.3 Class diagram conventions

Table 4 shows the notation used for classes in class diagrams.

Table 3 — Class diagram notation for classes

Notation			Description
Class Name	Class Name	Class Name	A class with no attributes or operations.
Class Name Attribute01[1] Attribute02[1]	Class Name Attribute01[1] Attribute02[1]		A class with attributes and no operations.
	Class Name Operation01() Operation02()		A class with operations and no attributes.
	Class Name Attribute01[1] Attribute02[1] Operation01() Operation02()		A class with attributes and operations.
	Class Name Attribute01[1..*] Attribute02[1] Operation01() Operation02()		A class with attributes that have a specified multiplicity (see table 4) and operations.

Table 4 shows the notation used to indicate multiplicity class diagrams.

Table 4 — Multiplicity notation

Notation	Description
not specified	The number of instances of an attribute is not specified.
1	One instance of the class or attribute exists.
0..*	Zero or more instances of the class or attribute exist.
1..*	One or more instances of the class or attribute exist.
0..1	Zero or one instance of the class or attribute exists.
n..m	n to m instances of the class or attribute exist (e.g., 2..8).
x, n..m	Multiple disjoint instances of the class or attribute exist (e.g., 2, 8..15).
^a See figure 2 and figure 3 for examples of multiplicity notation.	

Table 5 shows the notation used to denote association (i.e., “knows about”) relationships between classes.

Unless the two classes in an association relationship also have an aggregation relationship, association relationships have multiplicity notation (see table 4) at each end of the relationship line.

Table 5 — Class diagram notation for associations

Notation	Description
<p>association_name</p> <p>Class A</p> <p>Class B</p> <p>1..*</p> <p>0..1</p> <p>Multiplicity notation</p>	Class A knows about Class B (i.e., read as “Class A association_name Class B”) and Class B knows about Class A (i.e., read as “Class B association name Class A”).
<p>Class A</p> <p>Class B</p> <p>1</p> <p>0..1</p>	Class B knows about Class A (i.e., read as “Class B knows about Class A”) but Class A does not know about Class B.
<p>role name</p> <p>Class A</p> <p>Class B</p> <p>0..*</p> <p>0..1</p>	Class A knows about Class B (i.e., read as “Class A uses the role name attribute of Class B”) but Class B does not know about Class A.
Note - The use of role names and association names is optional.	

See figure 2 for examples of association relationships between classes.

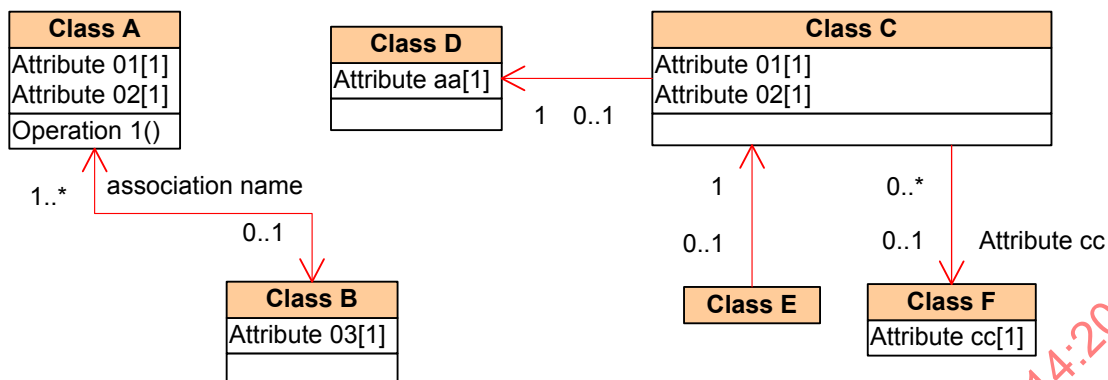

Figure 2 — Examples of association relationships in class diagrams

Table 6 shows the notation used to denote aggregation (i.e., “is a part of” or “contains”) relationships between classes. The aggregation relationship is a specific type of association and always include multiplicity notation (see table 4) at each end of the relationship line.

Table 6 — Class diagram notation for aggregations

Notation	Description
<p>Multiplicity notation</p>	The Part class is part of the Whole class and may continue to exist even if the Whole class is removed (i.e., read as “the whole contains the part”).
	The Part class is part of the Whole class, shall only belong to one Whole class, and shall not continue to exist if the Whole class is removed (i.e., read as “the whole contains the part”).

See figure 3 for examples of aggregation relationships between classes.

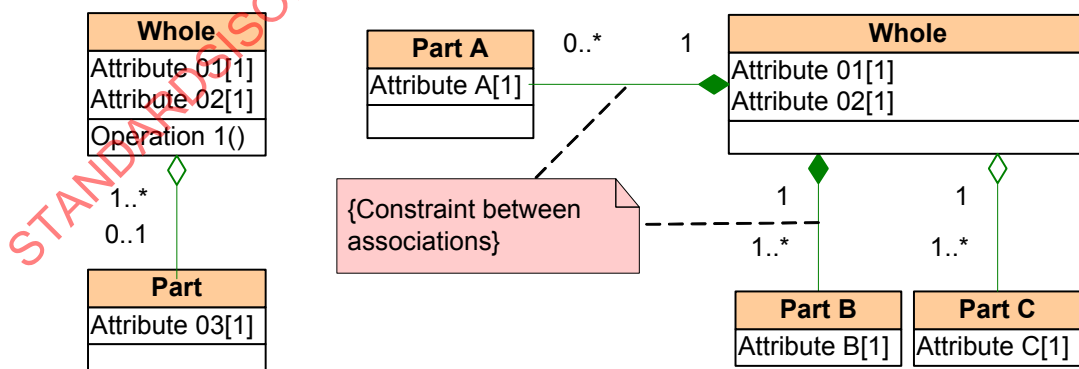

Figure 3 — Examples of aggregation relationships in class diagrams

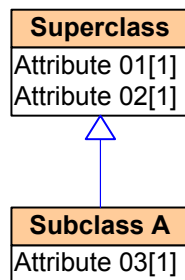

Table 7 shows the notation used to denote generalization (i.e., “is a kind of”) relationships between classes.

Table 7 — Class diagram notation for generalizations

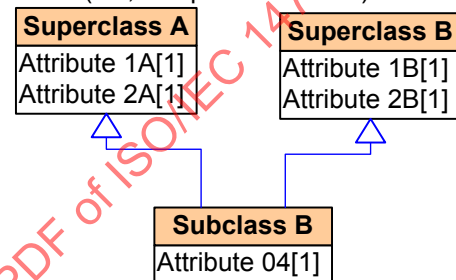

Notation	Description
	Subclass is a kind of superclass. A subclass shares all the attributes and operations of the superclass (i.e., the subclass inherits from the superclass).

See figure 4 for examples of generalization relationships between classes.

Single superclass/single subclass:

Multiple superclasses/single subclass
(i.e., multiple inheritance):

Single superclass/multiple subclasses:

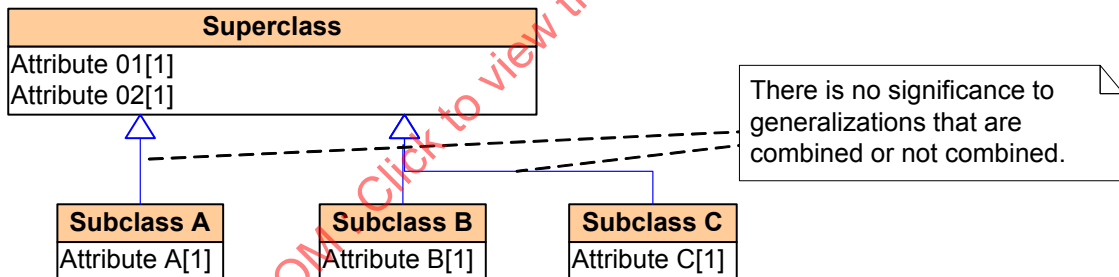

Figure 4 — Example of generalization relationships in class diagrams

Table 8 shows the notation used to denote dependency (i.e., “depends on”) relationships between classes.

Table 8 — Class diagram notation for dependency

Notation	Description
	Class A depends on class B. A change in class B may cause a change in class A.

See figure 5 for an example of a dependency relationship between classes.

Figure 5 — Example of a dependency relationship in class diagrams

3.6.1.4 Object diagram conventions

Table 9 shows the notation used for objects in object diagrams.

Table 9 — Object diagram notation for objects

Notation	Description
<code>label : Class Name</code>	Notation for a named object with no attributes.
<code>label : Class Name</code> Attribute01 = x Attribute02 = y	Notation for a named object with attributes.
<code>: Class Name</code>	Notation for a anonymous object with no attributes.
<code>: Class Name</code> Attribute01 = x Attribute02 = y	Notation for a anonymous object with attributes.

Table 10 shows the notation used to denote link relationship between objects.

Table 10 — Object diagram notation for link

Notation	Description
<code>: Object A</code> — <code>: Object B</code>	An instance of an association between object A and object B.

See figure 6 for examples of a link relationships between objects.

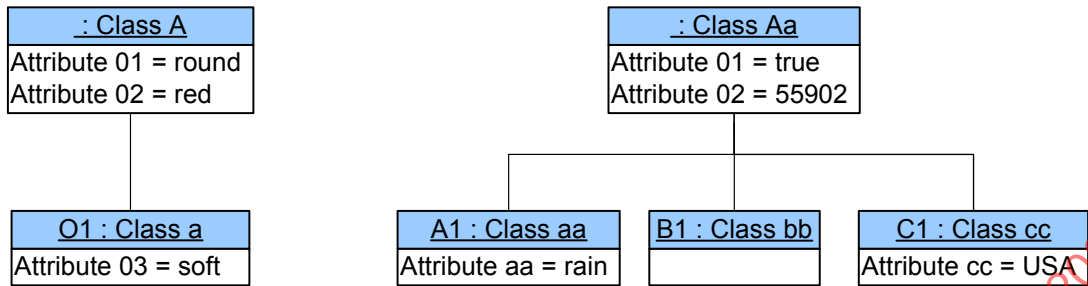

Figure 6 — Examples of link relationships for object diagrams

3.6.2 Notation for procedure calls

In this standard, the model for functional interfaces between entities is a procedure call (see 3.1.83). Such interfaces are specified using the following notation:

[Result =] Procedure Name (IN ([input-1] [,input-2] ...), OUT ([output-1] [,output-2] ...))

Where:

Result: A single value representing the outcome of the procedure call.

Procedure Name: A descriptive name for the function modeled by the procedure call.

Input-1, Input-2, ...: A comma-separated list of names identifying caller-supplied input arguments.

Output-1, Output-2, ...: A comma-separated list of names identifying output arguments to be returned by the procedure call.

"[...]": Brackets enclosing optional or conditional arguments.

This notation allows arguments to be specified as inputs and outputs. The following is an example of a procedure call specification:

Found = **Search** (IN (Pattern, Item List), OUT ([Item Found]))

Where:

Found = Flag

Flag, if set to one, indicates that a matching item was located.

Input Arguments:

Pattern = ... /* Definition of **Pattern** argument */

Argument containing the search pattern.

Item List = Item<NN> /* Definition of **Item List** as an array of NN **Item** arguments*/

Contains the items to be searched for a match.

Output Arguments:

Item Found = Item ... /* Item located by the search procedure call */

This argument is only returned if the search succeeds.

3.6.3 Notation for state diagrams

All state diagrams use the notation shown in figure 7.

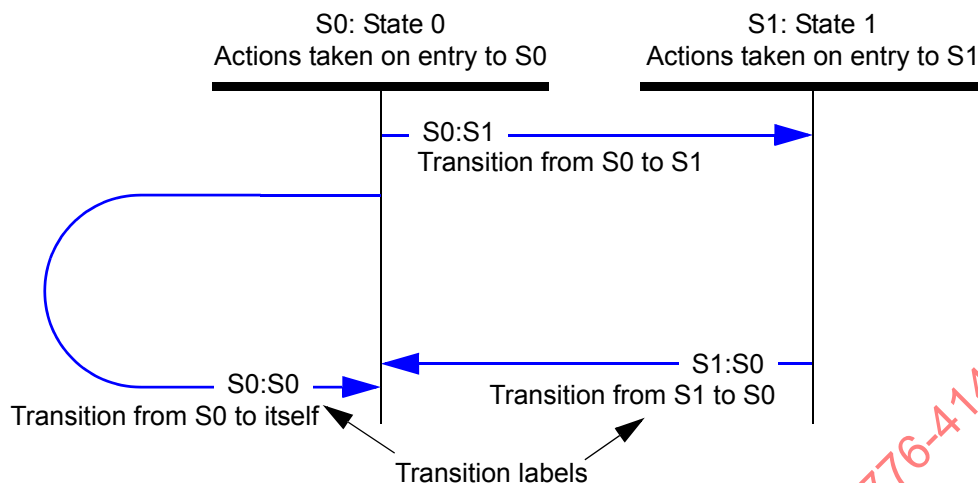

Figure 7 — Example state diagram

The state diagram is followed by a list of the state transitions using the transition labels. Each transition is described in the list with particular attention to the conditions that cause the transition to occur and special conditions related to the transition. Using figure 7 as an example, the transition list reads as follows:

Transition S0:S1: This transition occurs when state S0 is exited and state S1 is entered.

Transition S1:S0: This transition occurs when state S1 is exited and state S0 is entered.

Transition S0:S0: This transition occurs when state S0 transitions to itself. The reason for a transition from S0 to itself is to specify that the actions taken whenever state S0 is entered are repeated every time the transition occurs.

A system specified in this manner has the following properties:

- time elapses only within discrete states;
- state transitions are instantaneous; and
- every time a state is entered, the actions of that state are started. Note that this means that a transition that points back to the same state restarts the actions from the beginning.

4 SCSI architecture model

4.1 Introduction

The purpose of the SCSI architecture model is to:

- a) provide a basis for the coordination of SCSI standards development that allows each standard to be placed into perspective within the overall SCSI architecture model;
- b) establish a layered model in which standards may be developed;
- c) provide a common reference for maintaining consistency among related standards; and
- d) provide the foundation for application compatibility across all SCSI interconnect and SCSI transport protocol environments by specifying generic requirements that apply uniformly to all implementation standards within each functional area.

The development of this standard is assisted by the use of an abstract model. To specify the external behavior of a SCSI system, elements in a system are replaced by functionally equivalent components within this model. Only externally observable behavior is retained as the standard of behavior. The description of internal behavior in this standard is provided only to support the definition of the observable aspects of the model. Those aspects are limited to the generic properties and characteristics needed for host applications to interoperate with SCSI devices in any SCSI interconnect and SCSI transport protocol environment. The model does not address other requirements that may be essential to some I/O system implementations (e.g., the mapping from SCSI device addresses to network addresses, the procedure for discovering SCSI devices on a network, and the definition of network authentication policies for SCSI initiator devices or SCSI target devices). These considerations are outside the scope of this standard.

The set of SCSI standards specifies the interfaces, functions, and operations necessary to ensure interoperability between conforming SCSI implementations. This standard is a functional description. Conforming implementations may employ any design technique that does not violate interoperability.

The SCSI architecture model is described in terms of classes (see 3.1.13), protocol layers, and service interfaces between classes. As used in this standard, classes are abstractions, encapsulating a set of related functions (i.e., attributes), operations, data types, and other classes. Certain classes are defined by SCSI (e.g., an interconnect), while others are needed to understand the functioning of SCSI but have implementation definitions outside the scope of SCSI (e.g., a command). These classes exhibit well-defined and observable behaviors, but they do not exist as separate physical elements. A class may contain a single attribute or be a complex entity that may:

- a) contain multiple attributes; or
- b) perform a set of operations or services on behalf of another class.

Service interfaces are defined between distributed classes and protocol layers. The template for a distributed service interface is the client-server model described in 4.3. The structure of a SCSI I/O system is specified in 4.5 by defining the relationship among classes. The set of distributed services to be provided are specified in clause 5 and clause 7.

Requirements that apply to each SCSI transport protocol standard are specified in the SCSI transport protocol service model described in 5.4, 6.4, and 7.12. The model describes required behavior in terms of layers, classes within layers and SCSI transport protocol service transactions between layers.

4.2 Compliance Requirements

As shown in figure 8, all SCSI implementation standards shall reflect the generic requirements defined herein. In addition, an implementation claiming SCSI compliance shall conform to the applicable implementation requirements defined in this standard and the appropriate SCSI implementation standards. In the event of a conflict between this standard and other SCSI standards, the requirements of this standard shall apply.

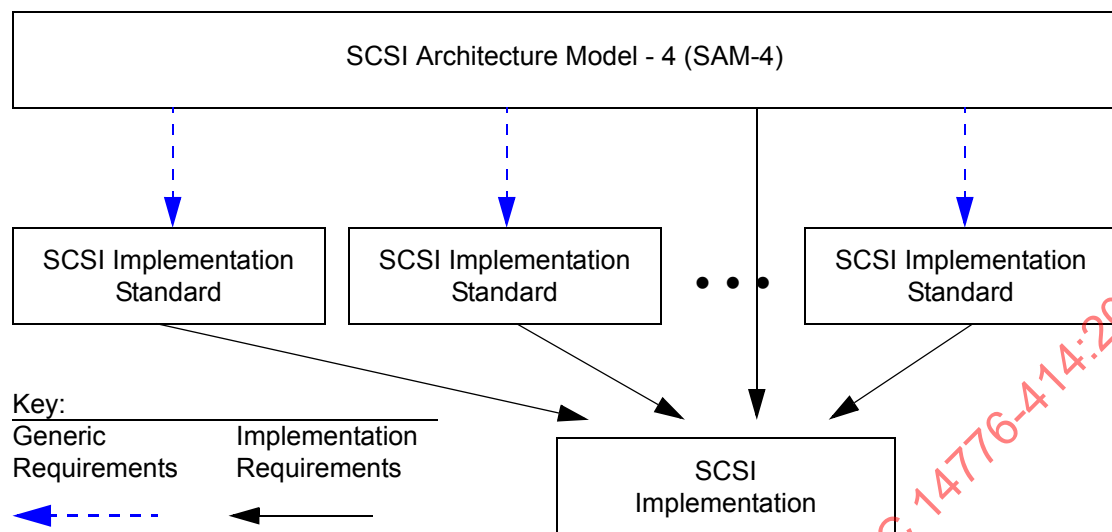

Figure 8 — Requirements precedence

4.3 The SCSI distributed service model

Service interfaces between distributed classes are represented by the client-server model shown in figure 9. Dashed horizontal lines with arrowheads denote a single request-response transaction as it appears to the client and server. The solid lines with arrowheads indicate the actual transaction path through a service delivery subsystem. In such a model, each client or server is a single thread of processing that runs concurrently with all other clients or servers.

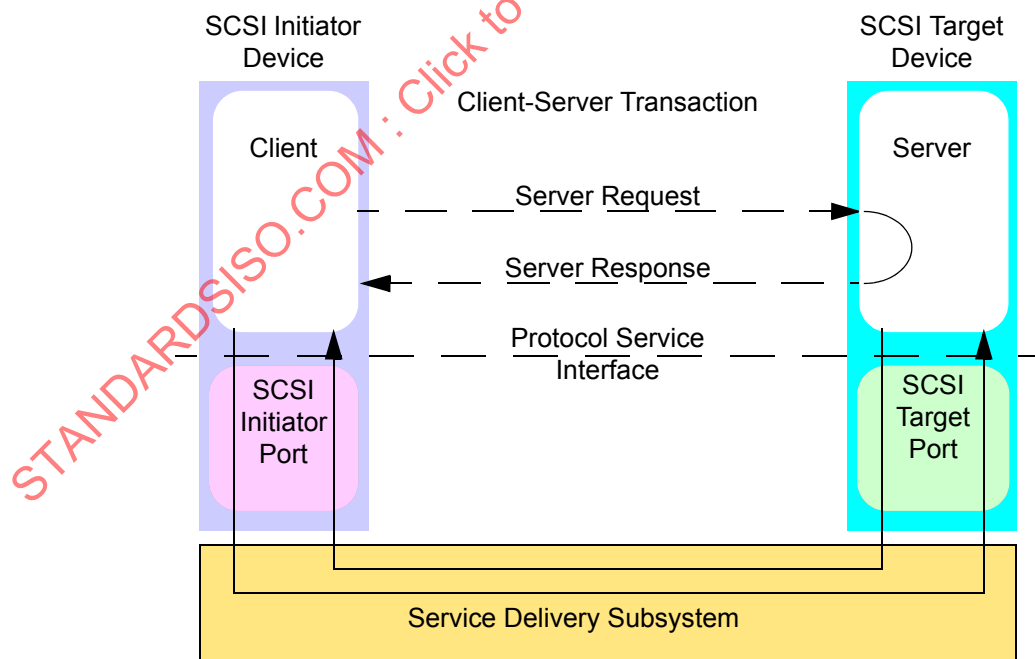

Figure 9 — Client-server model

A client-server transaction is represented as a procedure call with inputs supplied by the caller (i.e., the client). The procedure call is processed by the server and returns outputs and a procedure call status. A client directs

requests to a remote server via the SCSI initiator port and service delivery subsystem and receives a completion response or a failure notification. The request identifies the server and the service to be performed and includes the input data. The response conveys the output data and request status. A failure notification indicates that a condition has been detected (e.g., a reset or service delivery failure) that precludes request completion.

As seen by the client, a request becomes pending when it is passed to the SCSI initiator port for transmission. The request is complete when the server response is received or when a failure notification is sent. As seen by the server, the request becomes pending upon receipt and completes when the response is passed to the SCSI target port for return to the client. As a result there may be a time skew between the server and client's perception of request status and server state.

Client-server relationships are not symmetrical. A client only originates requests for service. A server only responds to such requests.

The client requests an operation provided by a server located in another SCSI device and waits for completion, which includes transmission of the request to and response from the remote server. From the client's point of view, the behavior of a service requested from another SCSI device is indistinguishable from a request processed in the same SCSI device. In this model, confirmation of successful request or response delivery by the sender is not required. The model assumes that delivery failures are detected by the SCSI initiator port or within a service delivery subsystem.

4.4 The SCSI client-server model

4.4.1 SCSI client-server model overview

As shown in figure 10, each SCSI target device provides services performed by device servers and task management functions performed by task managers. A logical unit is a class that implements one of the device functional models described in the SCSI command standards and processes commands (e.g., reading from or writing to the media). Each command defines a unit of work to be performed by the logical unit that may be externally referenced and controlled through requests issued to the task manager.

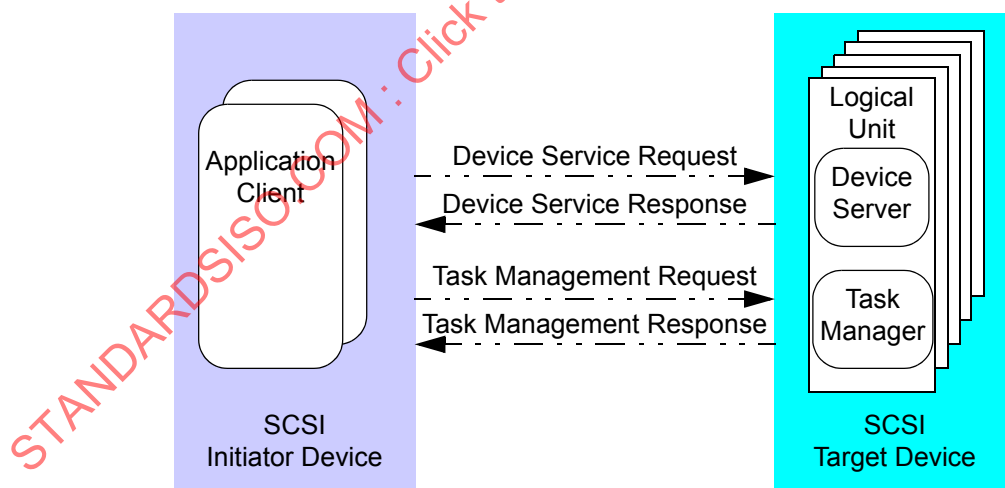

Figure 10 — SCSI client-server model

All requests originate from application clients residing within a SCSI initiator device. An application client is independent of the interconnect and SCSI transport protocol (e.g., an application client may correspond to the device driver and any other code within the operating system that is capable of managing I/O requests without requiring knowledge of the interconnect or SCSI transport protocol).

As described in 4.3, each request takes the form of a procedure call with arguments and a status to be returned. An application client may request processing of a command or a task management function through

a request directed to the device server within a logical unit. Device service requests are used to request the processing of commands (see clause 5) and task manager requests are used to request the processing of task management functions (see clause 7).

4.4.2 Synchronizing client and server states

One way a client is informed of changes in server state is through the arrival of server responses. Such state changes occur after the server has sent the associated response and possibly before the response has been received by the SCSI initiator device (e.g., the SCSI target device changes state upon processing the **Send Command Complete** procedure call (see 5.4.2), but the application client is not informed of the state change until the **Command Complete Received** SCSI transport protocol service confirmation arrives).

SCSI transport protocols may require the SCSI target device to verify that the response has been received without error before completing a state change. State changes controlled in this manner are said to be synchronized. Since synchronized state changes are not assumed or required by the SCSI architecture model, there may be a time lag between the occurrence of a state change within the SCSI target device and the SCSI initiator device's awareness of that change.

This standard assumes that state synchronization, if required by a SCSI transport protocol standard, is enforced by a service delivery subsystem transparently to the server (i.e., whenever the server invokes a SCSI transport protocol service to return a response as described in 7.12 and 5.4. It is assumed that the SCSI port for such a SCSI transport protocol does not return control to the server until the response has been delivered without error to the SCSI initiator device).

4.4.3 Request/Response ordering

Request or response transactions are said to be in order if, relative to a given pair of sending and receiving SCSI ports, transactions are delivered in the order they were sent.

A sender may require control over the order in which its requests or responses are presented to the receiver (e.g., the sequence in which requests are received is often important whenever a SCSI initiator device issues a series of commands with the ORDERED task attribute to a logical unit as described in clause 8). In this case, the order in which these commands are completed, and hence the final state of the logical unit, may depend on the order in which these commands are received. The SCSI initiator device may develop knowledge about the state of commands and task management functions and may take action based on the nature and sequence of SCSI target device responses (e.g., a SCSI initiator device should be aware that further responses are possible from an aborted command because the command completion response may be delivered out of order with respect to the abort response).

The manner in which ordering constraints are established is vendor specific. An implementation may delegate this responsibility to the application client (e.g., the device driver). In-order delivery may be an intrinsic property of a service delivery subsystem or a requirement established by the SCSI transport protocol standard.

The order in which task management requests are processed is not specified by the SCSI architecture model. The SCSI architecture model does not require in-order delivery of such requests or processing by the task manager in the order received. To guarantee the processing order of task management requests referencing a specific logical unit, an application client should not have more than one such request pending to that logical unit.

To simplify the description of behavior, the SCSI architecture model assumes in-order delivery of requests or responses to be a property of a service delivery subsystem. This assumption does not constitute a requirement. The SCSI architecture model makes no assumption about and places no requirement on the ordering of requests or responses for different I_T nexuses.

4.5 The SCSI structural model

The SCSI structural model represents a view of the classes in a SCSI I/O system as seen by the application clients interacting with the system. As shown in figure 11, the fundamental class is the SCSI Domain class that

represents an I/O system. A SCSI domain is made up of SCSI devices and a service delivery subsystem that transports commands, data, task management functions, and related information. A SCSI device contains clients or servers or both and the infrastructure to support them.

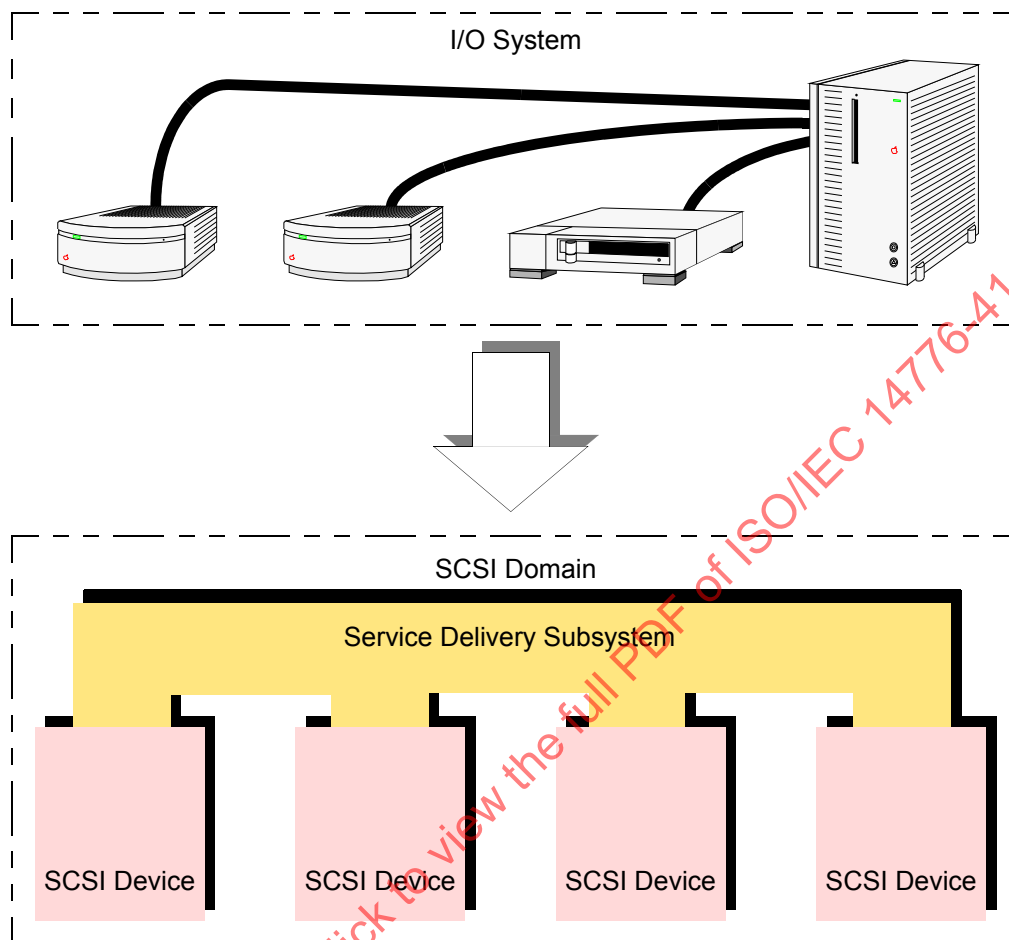

Figure 11 — SCSI I/O system and domain model

4.6 SCSI classes

4.6.1 SCSI classes overview

Figure 12 shows the main functional classes of the SCSI domain. This standard defines these classes in greater detail.

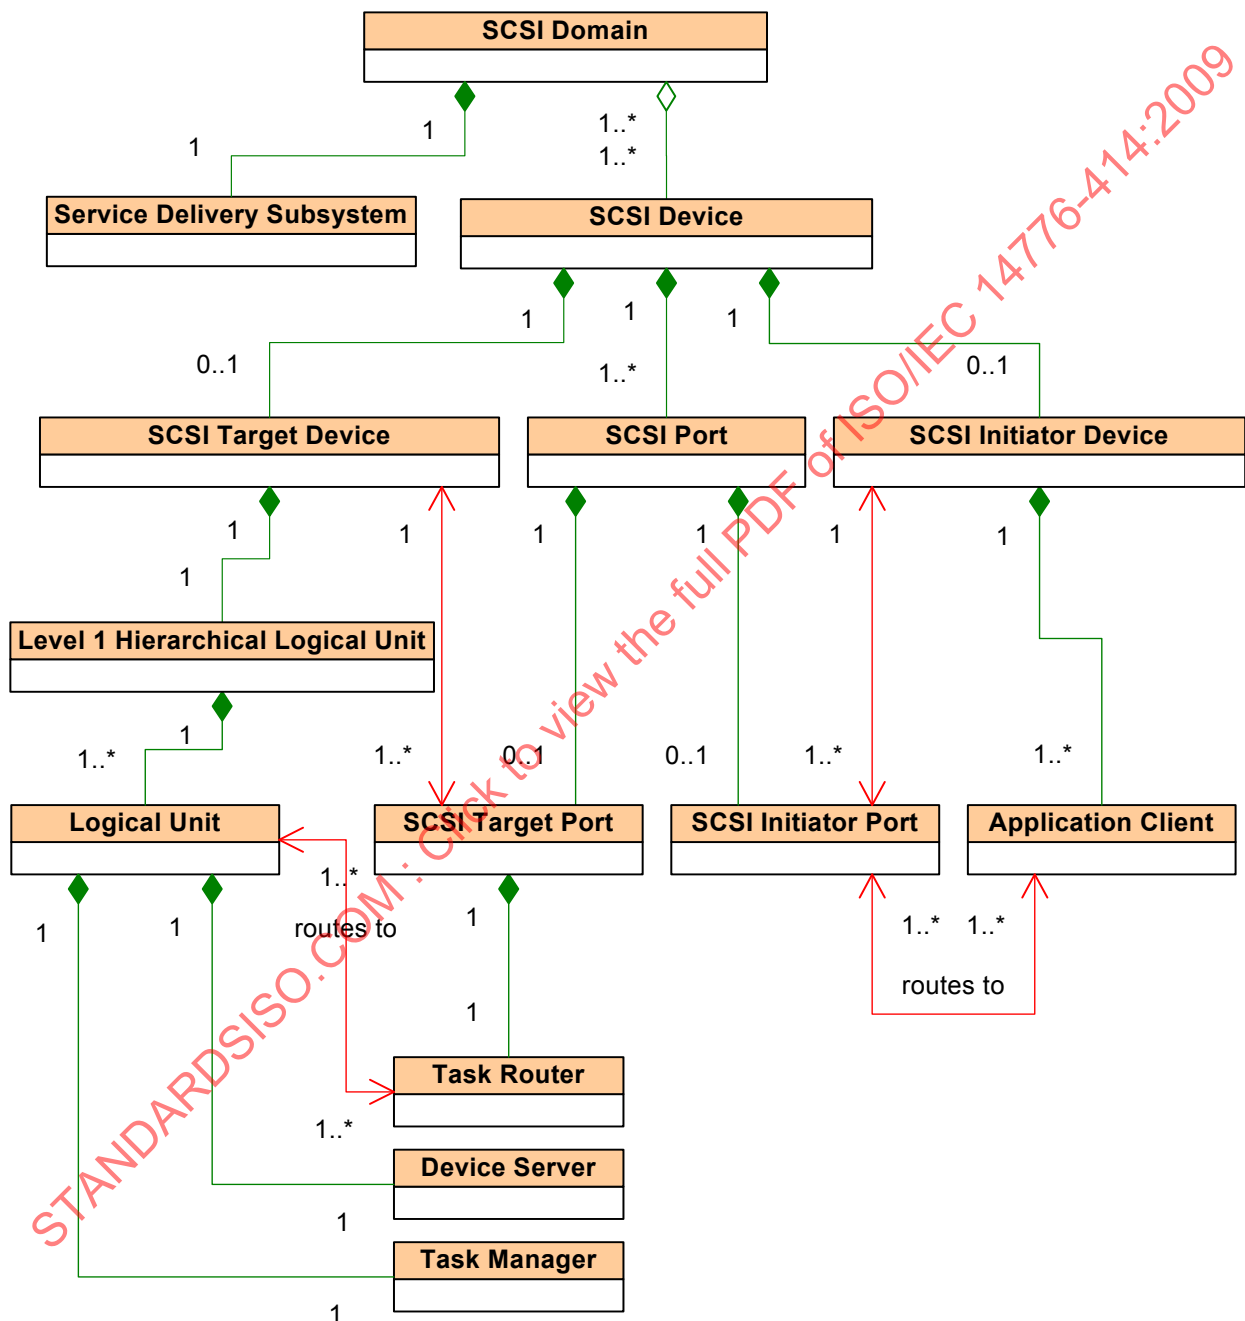

Figure 12 — SCSI Domain class diagram overview

4.6.2 SCSI Domain class

The SCSI Domain class (see figure 13) contains the:

- Service Delivery Subsystem class (see 4.6.3); and

b) SCSI Device class (see 4.6.4).

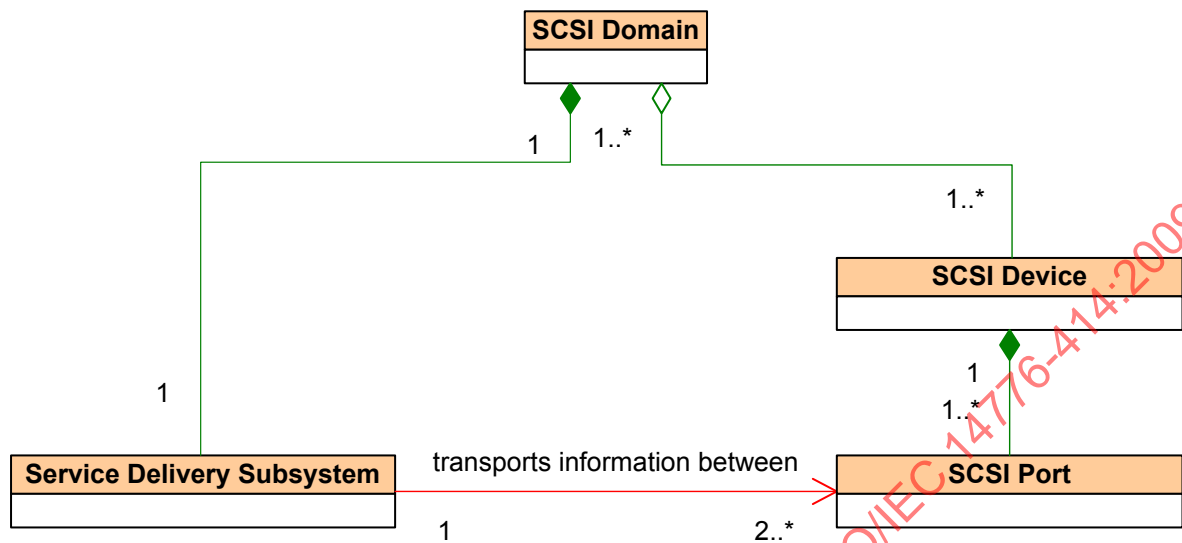

Figure 13 — SCSI Domain class diagram

Each instance of a SCSI Domain class shall contain the following objects:

- a) one service delivery subsystem;
- b) one or more SCSI devices; and
- c) one or more SCSI ports.

See figure 14 for the instantiation of the minimum set of objects that make up a valid SCSI domain.

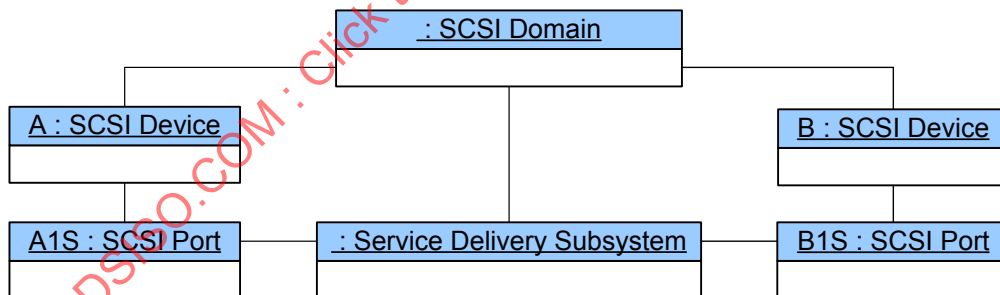

Figure 14 — SCSI domain object diagram

The boundaries of a SCSI domain are established by the system implementor, within the constraints of a specific SCSI transport protocol and associated interconnect standards.

4.6.3 Service Delivery Subsystem class

The Service Delivery Subsystem class (see figure 13) connects all the SCSI ports (see 3.1.101) in the SCSI domain, providing a mechanism through which application clients communicate with device servers and task managers.

A service delivery subsystem is composed of one or more interconnects that appear to a client or server as a single path for the transfer of requests and responses between SCSI devices.

A service delivery subsystem is assumed to provide error-free transmission of requests and responses between client and server. Although a device driver in a SCSI implementation may perform these transfers through several interactions with its STPL, the SCSI architecture model portrays each operation, from the viewpoint of the application client, as occurring in one discrete step. The request or response is:

- considered sent by the sender when the sender passes it to the SCSI port for transmission;
- in transit until delivered; and
- considered received by the receiver when it has been forwarded to the receiver via the destination SCSI device's SCSI port.

4.6.4 SCSI Device class

4.6.4.1 SCSI Device class overview

The SCSI Device class (see figure 15) contains the:

- SCSI Port class (see 4.6.5); and
- SCSI Initiator Device class (see 4.6.9), the SCSI Target Device class (see 4.6.14), or both.

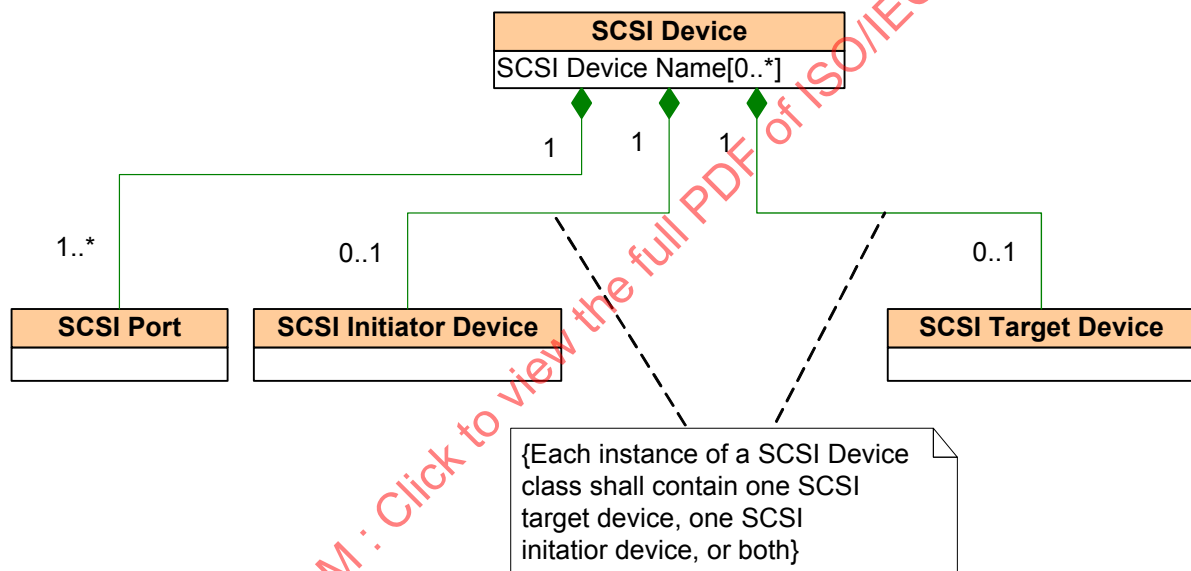

Figure 15 — SCSI Device class diagram

Each instance of a SCSI Device class shall contain:

- one or more SCSI ports; and
- one SCSI target device, one SCSI initiator device, or both.

4.6.4.2 SCSI Device Name attribute

The SCSI Device Name attribute contains a name (see 3.1.70) for a SCSI device that is world wide unique within the SCSI transport protocol of each SCSI domain in which the SCSI device has SCSI ports. For each supported SCSI transport protocol, a SCSI device shall have no more than one (i.e., zero or one) SCSI Device Name attribute that is not in the SCSI name string format (see SPC-4). A SCSI device shall have no more than one (i.e., zero or one) SCSI Device Name attribute in the SCSI name string format regardless of the number of SCSI transport protocols supported by the SCSI device. If a SCSI device has a SCSI Device Name attribute in the SCSI name string format then the SCSI device should have only one SCSI Device Name attribute. A SCSI device name shall never change and may be used for persistent identification of a SCSI device in contexts where specific references to port names or port identifiers is not required.

A SCSI transport protocol standard may require that a SCSI device include a SCSI Device Name attribute if the SCSI device has SCSI ports in a SCSI domain of that SCSI transport protocol. The SCSI Device Name

attribute may be made available to other SCSI devices or SCSI ports in a given SCSI domain in SCSI transport protocol specific ways.

The SCSI device name for a SCSI target device may be reported in a target device name designation descriptor in the Device Identification VPD page (see SPC-4). The SCSI device name for a SCSI initiator device is reported by methods outside the scope of this standard.

4.6.5 SCSI Port class

4.6.5.1 SCSI Port class overview

The SCSI Port class (see figure 16) contains the:

- SCSI Target Port class (see 4.6.6);
- SCSI Initiator Port class (see 4.6.7.1); or
- both.

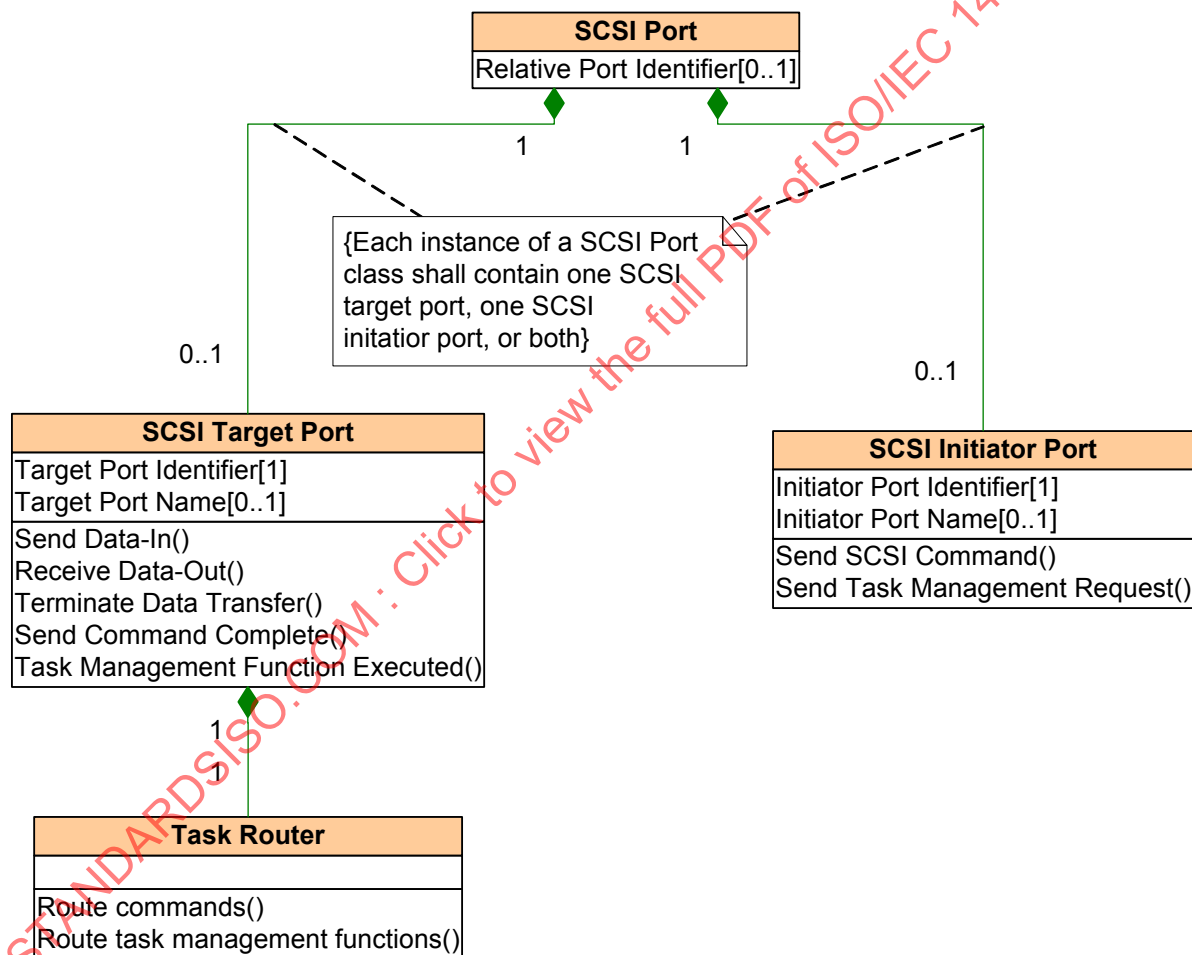

Figure 16 — SCSI Port class diagram

Each instance of a SCSI Port class shall contain:

- one SCSI target port that shall contain:
 - one task router;
- one SCSI initiator port; or
- both.

4.6.5.2 Relative Port Identifier attribute

The Relative Port Identifier attribute identifies a SCSI target port or a SCSI initiator port relative to other SCSI ports in a SCSI target device and any SCSI initiator devices contained within that SCSI target device. A SCSI target device may assign relative port identifiers to its SCSI target ports and any SCSI initiator ports. If relative port identifiers are assigned, the SCSI target device shall assign each of its SCSI target ports and any SCSI initiator ports a unique relative port identifier from 1 to 65 535. SCSI target ports and SCSI initiator ports share the same number space.

The Device Identification VPD page (see SPC-4) and the SCSI Ports VPD page (see SPC-4) report relative port identifiers.

The relative port identifiers are not required to be contiguous. The relative port identifier for a SCSI port shall not change once assigned unless physical reconfiguration of the SCSI target device occurs.

4.6.6 SCSI Target Port class

4.6.6.1 SCSI Target Port class overview

The SCSI Target Port class (see figure 16) contains the Task Router class (see 4.6.8).

The SCSI Target Port class connects SCSI target devices to a service delivery subsystem.

The SCSI Target Port class processes the:

- a) Send Data-in operation (see 5.4.3.2.1) to send data to the service delivery subsystem;
- b) Receive Data-out operation (see 5.4.3.3.1) to receive data from the service delivery subsystem;
- c) Terminate Data Transfer operation (see 5.4.3.4) to terminate data transfers;
- d) Send Command Complete operation (see 5.4.2.4) to transmit a command complete indication to the service delivery subsystem; and
- e) Task Management Function Executed operation (see 7.12.4) to transmit a task management function executed indication to the service delivery subsystem.

4.6.6.2 Target Port Identifier attribute

The Target Port Identifier attribute contains a target port identifier (see 3.1.120) for a SCSI target port. The target port identifier is a value by which a SCSI target port is referenced within a domain.

The target port identifier may be reported in a target port name designation descriptor in the Device Identification VPD page (see SPC-4). If a SCSI target port has a target port identifier and a target port name see SPC-4 to determine which is reported.

4.6.6.3 Target Port Name attribute

A Target Port Name attribute contains an optional name (see 3.1.70) of a SCSI target port that is world wide unique within the SCSI transport protocol of the SCSI domain of that SCSI target port. A SCSI target port shall have at most one name. A SCSI target port name shall never change and may be used for persistent identification of a SCSI target port.

A SCSI transport protocol standard may require that a SCSI target port include a SCSI target port name if the SCSI target port is in a SCSI domain of that SCSI transport protocol. The SCSI target port name may be made available to other SCSI devices or SCSI ports in the given SCSI domain in SCSI transport protocol specific ways.

The target port name may be reported in a target port name designation descriptor in the Device Identification VPD page (see SPC-4). If a SCSI target port has a target port identifier and a target port name see SPC-4 to determine which is reported.

4.6.7 SCSI Initiator Port class

4.6.7.1 SCSI Initiator Port class overview

The SCSI Initiator Port class (see figure 16) connects SCSI initiator devices to a service delivery subsystem.

The SCSI Initiator Port class processes the:

- a) Send SCSI Command operation (see 5.4.2.2) to send a command to the service delivery subsystem; and
- b) Send Task Management Request operation (see 7.12.2) to send a task management request to the service delivery subsystem.

4.6.7.2 Initiator Port Identifier attribute

The Initiator Port Identifier attribute contains the initiator port identifier for a SCSI initiator port. The initiator port identifier is a value by which a SCSI initiator port is referenced within a domain.

The initiator port identifier is reported by methods outside the scope of this standard.

4.6.7.3 Initiator Port Name attribute

A Initiator Port Name attribute contains an optional name (see 3.1.70) of a SCSI initiator port that is world wide unique within the SCSI transport protocol of the SCSI domain of that SCSI initiator port. A SCSI initiator port shall have at most one name. A SCSI initiator port name shall never change and may be used for persistent identification of a SCSI initiator port.

A SCSI transport protocol standard may require that a SCSI initiator port include a SCSI initiator port name if the SCSI initiator port is in a SCSI domain of that SCSI transport protocol. The SCSI initiator port name may be made available to other SCSI devices or SCSI ports in the given SCSI domain in SCSI transport protocol specific ways.

The initiator port name is reported by methods outside the scope of this standard.

4.6.8 Task Router class

The Task Router class (see figure 16) routes:

- a) commands between a task manager and a service delivery subsystem by processing the Route Command operation; and
- b) task management functions between a task manager and a service delivery subsystem by processing the Route Task Management Functions operation.

The task router routes commands and task management functions as follows:

- a) commands addressed to a valid logical unit are routed to the task manager in the specified logical unit;
- b) commands addressed to an incorrect logical unit are handled as described in 5.11;
- c) task management functions with I_T_L nexus scope (e.g., ABORT TASK SET, CLEAR TASK SET, CLEAR ACA, LOGICAL UNIT RESET, QUERY TASK SET, and QUERY ASYNCHRONOUS EVENT) or I_T_L_Q nexus scope (e.g., ABORT TASK and QUERY TASK) addressed to a valid logical unit are routed to the task manager in the specified logical unit;
- d) task management functions with an I_T nexus scope (e.g., I_T NEXUS RESET) are routed to the task manager in each logical unit about which the task router knows; and
- e) task management functions with I_T_L nexus scope or I_T_L_Q nexus scope addressed to an incorrect logical unit are handled as described in 7.12.

In some transport protocols, the task router may check for overlapped command identifiers on commands (see 5.10).

4.6.9 SCSI Initiator Device class

A SCSI Initiator Device class (see figure 17) is a SCSI Device class that contains the Application Client class (see 4.6.10).

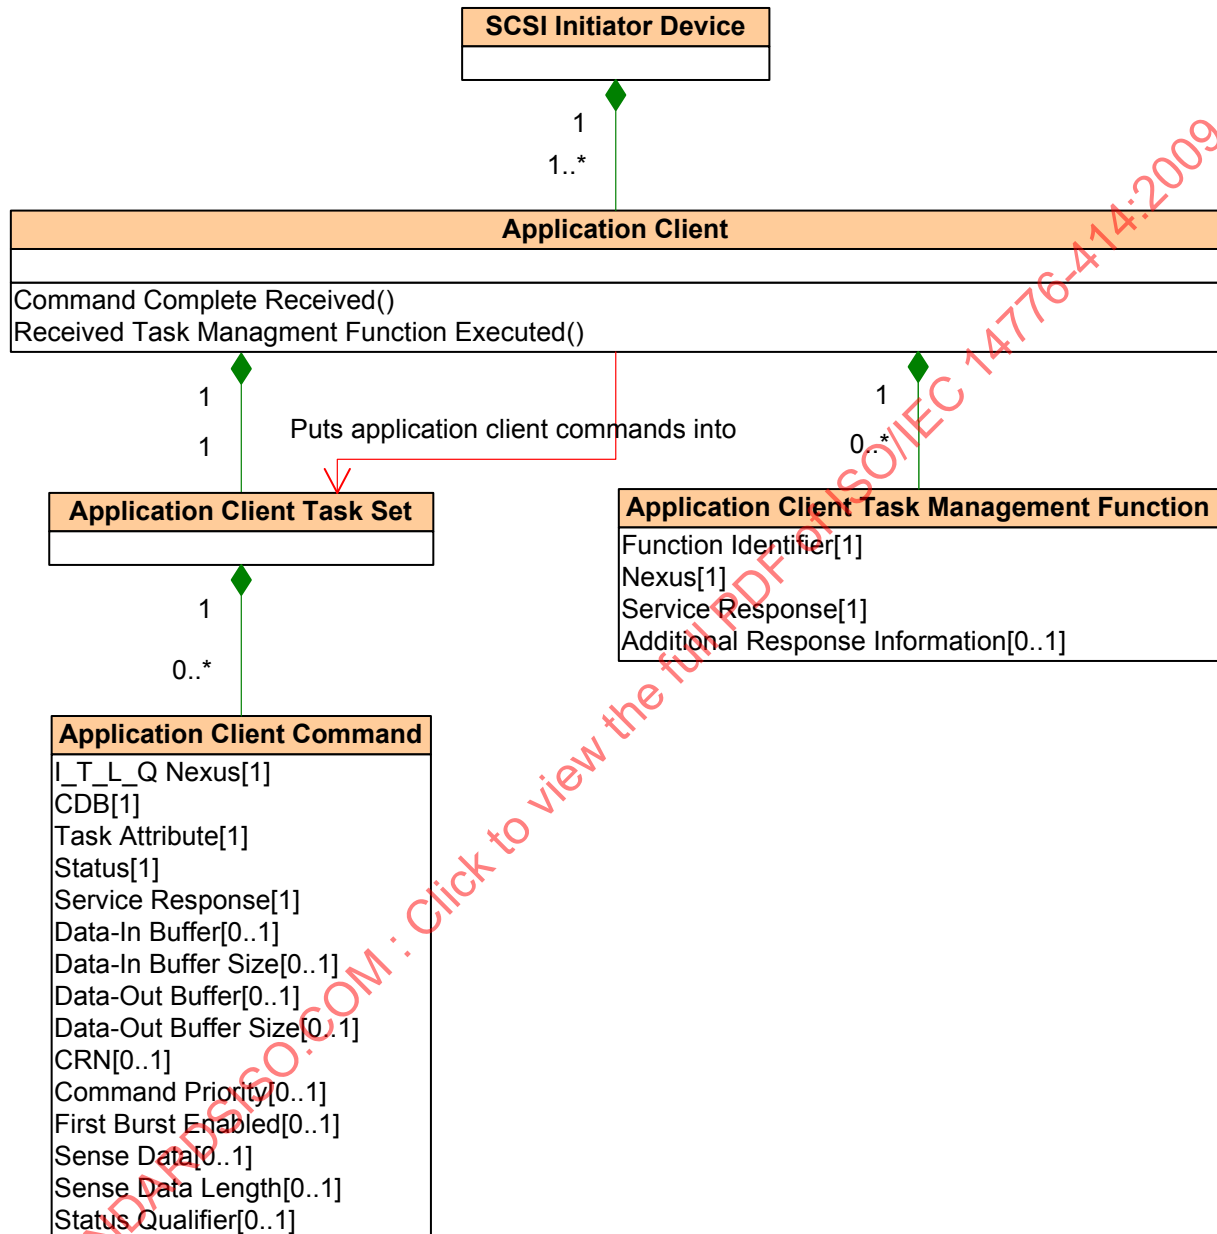

Figure 17 — SCSI Initiator Device class diagram

Each instance of a SCSI Initiator Device class shall contain the following objects:

- a) one or more application clients that contain:
 - A) zero or more application client task management functions; and
 - B) one application client task set.

4.6.10 Application Client class

An Application Client class (see figure 17) contains the:

- a) Application Client Task Management Function class (see 4.6.11); and

- b) Application Client Task Set class (see 4.6.12).

The Application Client class processes the:

- a) Command Complete Received operation (see 5.4.2.5) to determine when a requested command has completed; and
- b) Received Task Management Function Executed operation (see 7.12.5) to determine when a requested task management function has completed.

The Application Client class originates a command by issuing a Send SCSI Command request (see 5.4.2.2). Issuing the Send SCSI Command request causes the Initiator Port class to create an Application Client Command object that is placed into the application client task set. The Application Client Command object remains in the application client task set until the application client determines when a command that it has originated completes using the command lifetime (see 5.5), including the processing of a Command Complete Received operation.

The Application Client class originates a task management request by issuing a Send Task Management request (see 7.12.2). An Application Client class determines when a task management request that it has originated completes using the task management function lifetime information (see 7.11), including the processing of a Received Task Management Function Executed operation.

The application client may request processing of a task management function for:

- a) a logical unit through a request directed to the task manager within the logical unit; or
- b) all logical units known by a task router through a request directed to the task router within the target port.

The interactions between the task manager or a task router, and application client when a task management request is processed are shown in 7.13.

4.6.11 Application Client Task Management Function class

4.6.11.1 Application Client Task Management Function class overview

The Application Client Task Management Function class (see figure 17) represents a SCSI task management function (see clause 7).

4.6.11.2 Function Identifier attribute

The Function Identifier attribute contains a function identifier (see 7.12).

4.6.11.3 Nexus attribute

The Nexus attribute contains the nexus affected by the task management function (see 4.8).

4.6.11.4 Service Response attribute

The Service Response attribute contains the service response (see clause 7).

4.6.11.5 Additional Response Information attribute

The Additional Response Information attribute, if any, contains any additional response information for the task management function (see clause 7).

4.6.12 Application Client Task Set class

The Application Client Task Set class (see figure 17) contains the Application Client Command class (see 4.6.13).

Each instance of an Application Client Task Set class shall contain the zero or more application client commands object.

The interactions among the application client commands in an application client task set are not specified in this standard.

4.6.13 Application Client Command class

4.6.13.1 Application Client Command class overview

The Application Client Command class (see figure 17) represents a request to a logical unit to do work (see clause 5). A new command causes the creation of an application client command. The application client command persists until a command complete response is received or until the command is completed by a task management function or exception condition. For an example of the processing for a command see 5.7.

4.6.13.2 I_T_L_Q Nexus attribute

The I_T_L_Q Nexus attribute contains the I_T_L_Q nexus (see 4.8) of the command (see 5.4.2.2).

4.6.13.3 CDB attribute

The CDB attribute contains a CDB (see 5.2 and SPC-4) that defines the work to be performed by a logical unit (see 5.4.2.2).

4.6.13.4 Task Attribute attribute

The Task Attribute attribute (see 8.6) contains the task attribute (e.g., SIMPLE task attribute, ORDERED task attribute, HEAD OF QUEUE task attribute, ACA task attribute) of a command (see 5.4.2.2).

4.6.13.5 Status attribute

The Status attribute contains the status (see 5.3) of the completed command (see 5.4.2.5)

4.6.13.6 Service Response attribute

The Service Response attribute contains the service response for the completed command (see 5.4.2.5).

4.6.13.7 Data-In Buffer attribute

The Data-In Buffer attribute, if any, contains the Data-In Buffer argument from an Execute Command procedure call (see 5.4.2.5)

4.6.13.8 Data-In Buffer Size attribute

The Data-In Buffer Size attribute, if any, contains the Data-In Buffer Size argument from an Execute Command procedure call (see 5.4.2.2).

4.6.13.9 Data-Out Buffer attribute

The Data-Out Buffer attribute, if any, contains the Data-Out Buffer argument from an Execute Command procedure call (see 5.4.2.2).

4.6.13.10 Data-Out Buffer size attribute

The Data-Out Buffer Size attribute, if any, contains the Data-Out Buffer Size argument from an Execute Command procedure call (see 5.4.2.2).

4.6.13.11 CRN attribute

The CRN attribute, if any, contains the CRN of the command (see 5.4.2.2).

4.6.13.12 Command Priority attribute

The Command Priority attribute, if any, contains the priority (see 8.7) of the command (see 5.4.2.2).

4.6.13.13 First Burst Enabled attribute

The First Burst Enabled attribute, if any, specifies that first burst for the command is enabled (see 5.4.2.2).

4.6.13.14 Sense Data attribute

The Sense Data attribute, if any, contains the sense data (see 5.13) for the completed command (see 5.4.2.5).

4.6.13.15 Sense Data Length attribute

The Sense Data Length attribute, if any, contains the length of the sense data (see 5.13) for the completed command (see 5.4.2.5).

4.6.13.16 Status Qualifier attribute

The Status Qualifier attribute, if any, contains additional status information for the completed command (see 5.3.2 and 5.4.2.5).

4.6.14 SCSI Target Device class

The SCSI Target Device class (see figure 18) is a SCSI Device class that contains the Level 1 Hierarchical Logical Unit class (see 4.6.15).

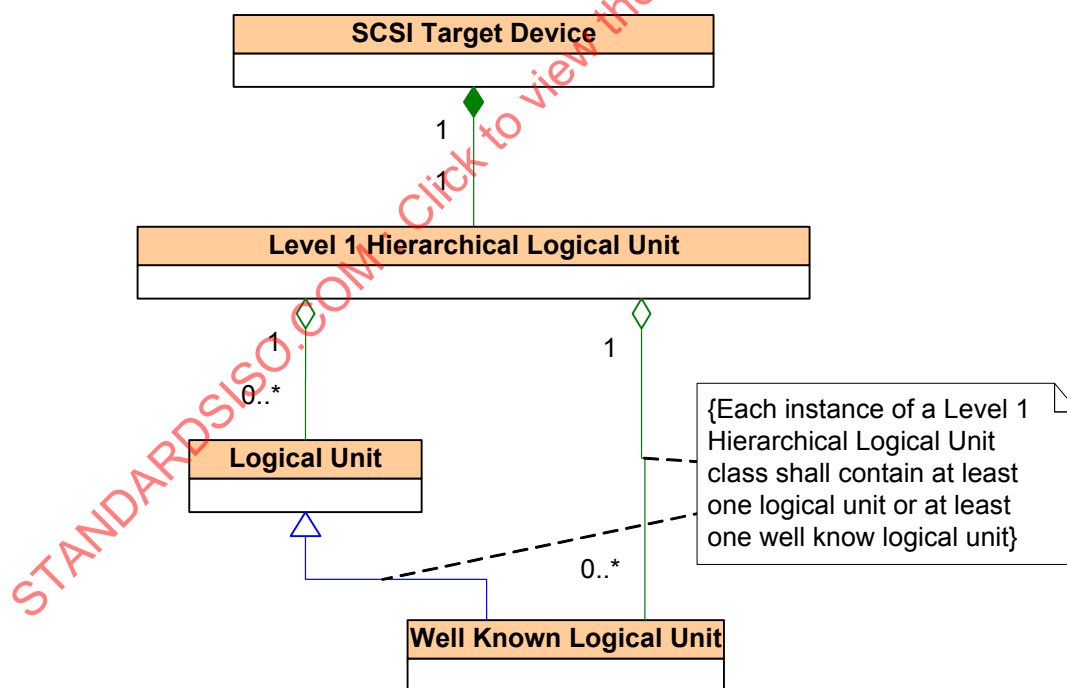

Figure 18 — SCSI Target Device class diagram

Each instance of the SCSI Target Device class shall contain one level 1 hierarchical logical unit object that contains the following objects:

- a) at least one logical unit or well known logical unit;
- b) zero or more logical units; and

- c) zero or more well known logical units.

4.6.15 Level 1 Hierarchical Logical Unit class

The Level 1 Hierarchical Logical Unit class (see figure 18 and figure 19) contains the:

- Logical Unit class (see 4.6.19);
- Well Known Logical Unit class (see 4.6.25); and
- Level 2 Hierarchical Logical Unit class (see 4.6.16).

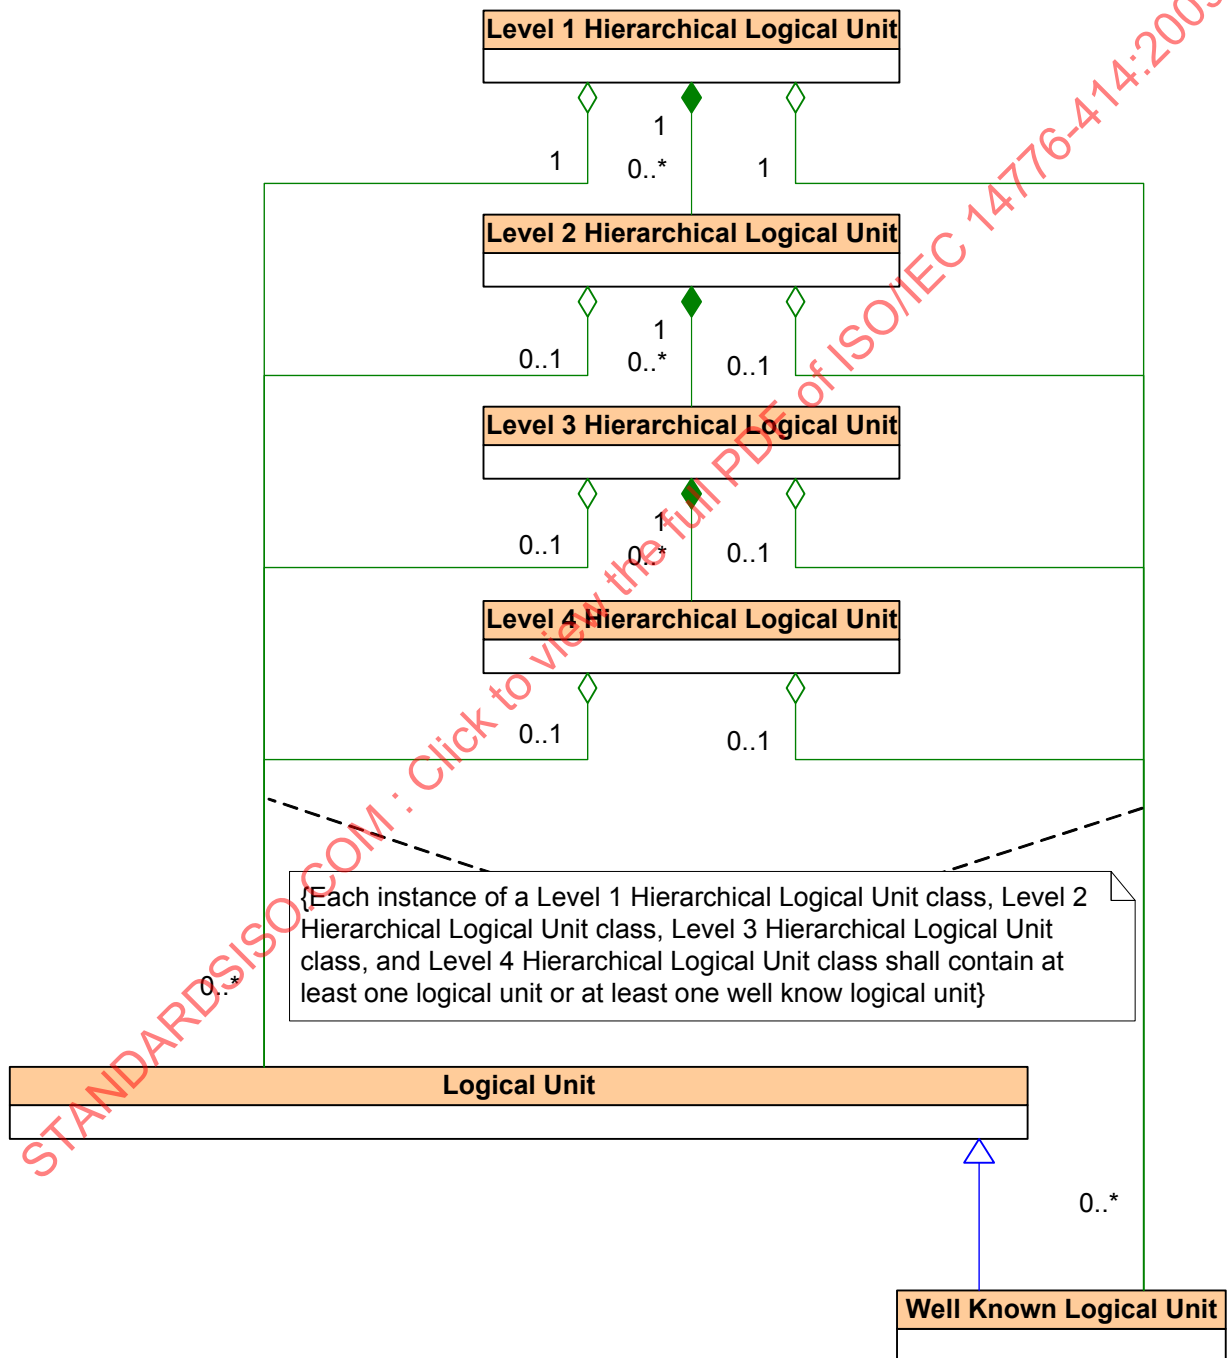

Figure 19 — Level 1 Hierarchical Logical Unit class

Each instance of a Level 1 Hierarchical Logical Unit class shall contain the following objects:

- a) at least one logical unit or well known logical unit;
- b) zero or more logical units;
- a) zero or more well known logical units;
- b) zero or more level 2 hierarchical logical units;
- c) zero or more level 3 hierarchical logical units; or
- d) zero or more level 4 hierarchical logical units.

Logical units and well known logical units at each level in the hierarchical logical unit structure are referenced by one of the following address methods:

- a) peripheral device address method (see 4.7.7);
- b) flat space addressing method (see 4.7.8);
- c) logical unit address method (see 4.7.9); or
- d) extended logical unit addressing method (see 4.7.10).

All peripheral device addresses, except LUN 0 (see 4.7.4), default to vendor specific values. All addressable entities, except well known logical units (see 4.6.25), may default to vendor specific values or may be defined by an application client (e.g., by the use of SCC-2 configuration commands).

Within the hierarchical logical unit structure there may be SCSI devices each of which contain a SCSI target device that:

- a) has multiple logical units that are accessible through SCSI target ports in one SCSI domain; and
- b) transfer SCSI operations to a SCSI target device in another SCSI domain through a SCSI initiator device and its associated SCSI initiator ports.

When using the peripheral device addressing method or the logical unit address method the SCSI domains accessed by these SCSI initiator ports are referred to as buses. A SCSI target device that has SCSI devices attached to these buses shall assign numbers, other than zero, to those buses. The bus numbers shall be used as components of the LUNs to the logical units attached to those buses, as described in 4.7.7 and 4.7.9.

When using the peripheral device addressing method or the logical unit address method SCSI devices shall assign a bus number of zero to all the logical units within the SCSI target device that are not connected to another SCSI domain.

4.6.16 Level 2 Hierarchical Logical Unit class

The Level 2 Hierarchical Logical Unit class (see figure 19) contains the:

- a) Logical Unit class;
- b) Well Known Logical Unit class; and
- c) Level 3 Hierarchical Logical Unit class (see 4.6.17).

The Level 2 Hierarchical Logical Unit class is a Hierarchical Logical Unit class placed at level 2 within the hierarchical logical unit structure.

All logical units and well known logical units contained within level 2 hierarchical logical unit shall have a Dependent Logical Unit attribute (see 4.6.19.4).

4.6.17 Level 3 Hierarchical Logical Unit class

The Level 3 Hierarchical Logical Unit class (see figure 19) contains the:

- a) Logical Unit class;
- b) Well Known Logical Unit class; and
- c) Level 4 Hierarchical Logical Unit class (see 4.6.18).

The Level 3 Hierarchical Logical Unit class is a Hierarchical Logical Unit class placed at level 3 within the hierarchical logical unit structure.

All logical units and well known logical units contained within level 3 hierarchical logical unit shall have a Dependent Logical Unit attribute (see 4.6.19.4).

4.6.18 Level 4 Hierarchical Logical Unit class

The Level 4 Hierarchical Logical Unit class (see figure 19) contains the:

- a) Logical Unit class; and
- b) Well Known Logical Unit class.

The Level 4 Hierarchical Logical Unit class is a Hierarchical Logical Unit class placed at level 4 within the hierarchical logical unit structure.

All logical units and well known logical units contained within level 4 hierarchical logical unit shall have a Dependent Logical Unit attribute (see 4.6.19.4).

4.6.19 Logical Unit class

4.6.19.1 Logical Unit class overview

The Logical Unit class (see figure 20) contains the:

- a) Device Server class (see 4.6.20);
- b) Task Manager class (see 4.6.21);
- c) Task Management Function class (see 4.6.24); and
- d) Task Set class (see 4.6.22).

The Logical Unit class (see figure 20) may be substituted with the Well Known Logical Unit class (see 4.6.19.1).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 14776-414:2009

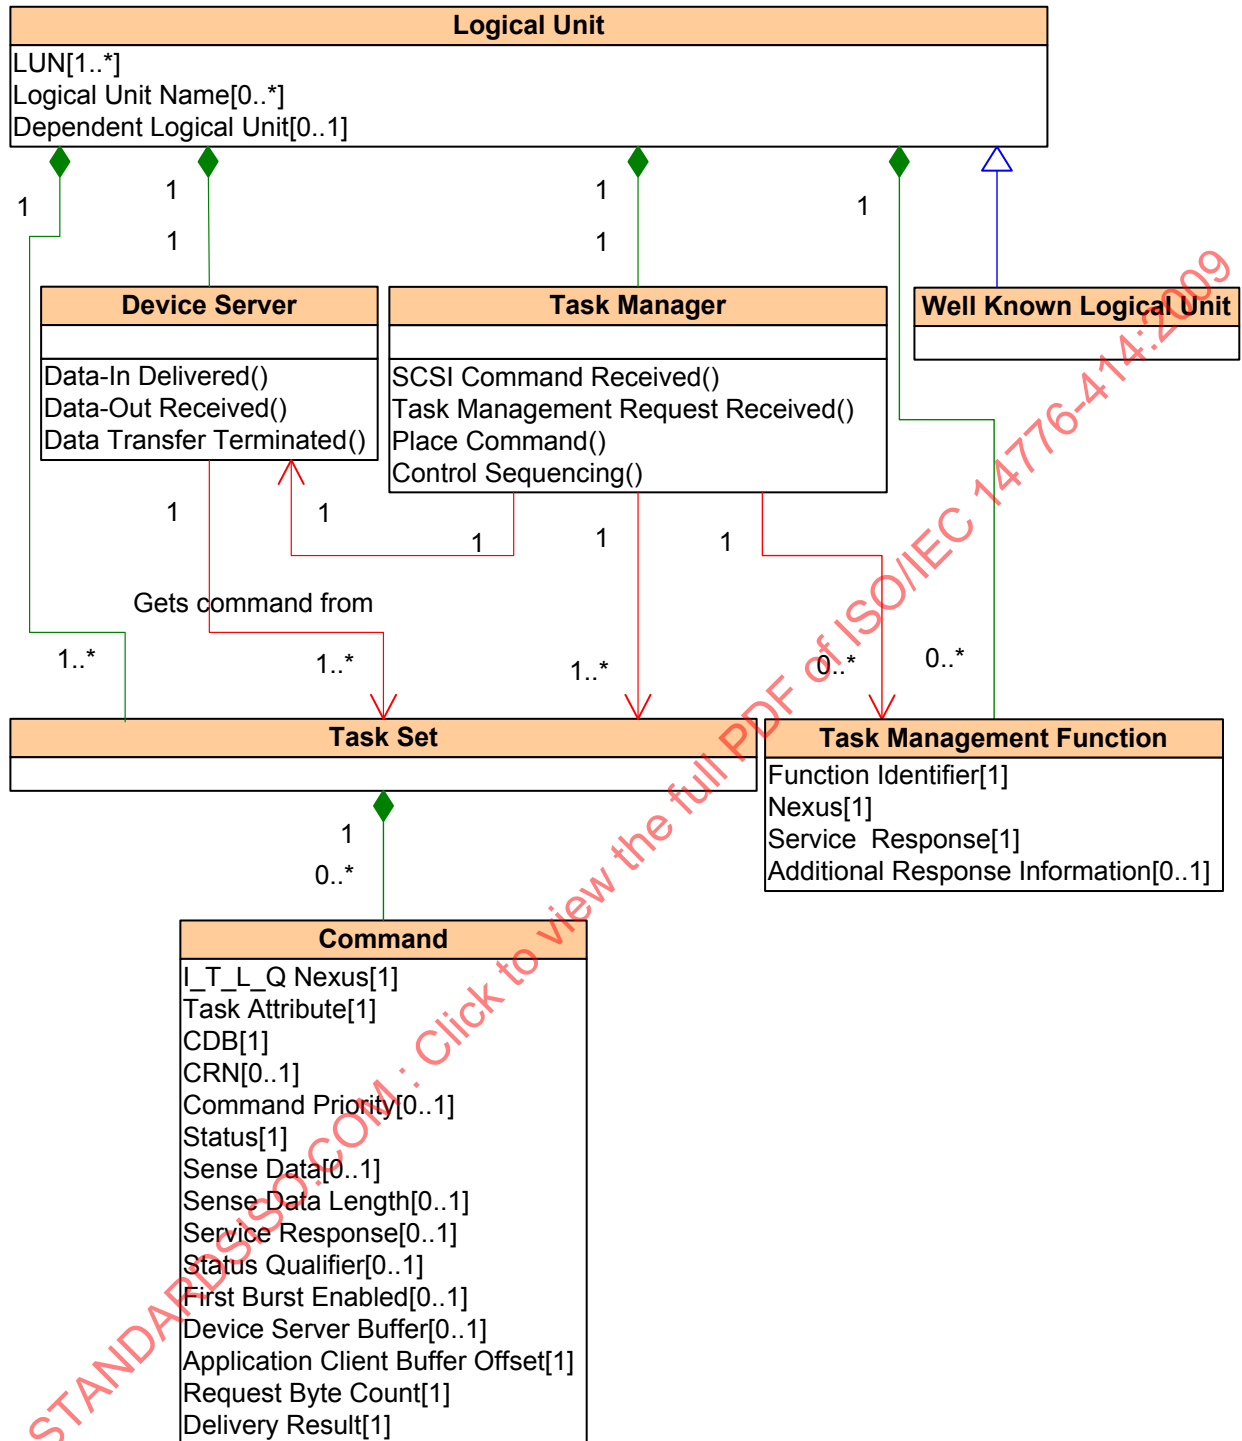

Figure 20 — Logical Unit class diagram

Each instance of a Logical Unit class shall contain the following objects:

- one device server;
- one task manager;
- zero or more task management functions; and
- one or more task sets.

The logical unit is the class to which commands are sent. One of the logical units within the SCSI target device shall be accessed using the LUN zero or the REPORT LUNS well-known logical unit number.

If the logical unit inventory changes for any reason (e.g., completion of initialization, removal of a logical unit, or creation of a logical unit), then the device server shall establish a unit attention condition (see 5.14) for the SCSI initiator port associated with every I_T nexus, with the additional sense code set to REPORTED LUNS DATA HAS CHANGED.

Data contained within a logical unit may be duplicated in whole or part on a different logical unit. The synchronization of that data between multiple logical units is outside the scope of this standard.

4.6.19.2 LUN attribute

The LUN attribute identifies the logical unit within a SCSI target device when accessed by a SCSI target port. If any logical unit within the scope of a SCSI target device includes one or more dependent logical units (see 4.6.19.4) in its composition, then all LUNs within the scope of the SCSI target device shall have the format described in 4.7.6. If there are no dependent logical units within the scope of the SCSI target device, the LUNs should have the format described in 4.7.5.

The 64-bit or 16-bit quantity called a LUN is the LUN attribute defined by this standard. The fields containing the acronym LUN that compose the LUN attribute are historical nomenclature anomalies, not LUN attributes. LUN attributes having different values represent different logical units, regardless of any implications to the contrary in 4.7 (e.g., LUN 00000000 00000000h is a different logical unit from LUN 40000000 00000000h and LUN 00FF0000 00000000h is a different logical unit from LUN 40FF0000 00000000h).

LUN(s) are required as follows:

- a) if access controls (see SPC-4) are not in effect, one LUN per logical unit; or
- b) if access controls are in effect, one LUN per SCSI initiator port that has access rights plus one default LUN per logical unit.

See 4.7 for a definition of the construction of LUNs to be used by SCSI target devices. Application clients should use only those LUNs returned by a REPORT LUNS command. The task router shall respond to LUNs other than those returned by a REPORT LUNS command (i.e., incorrect logical unit numbers) as specified in 5.11 and 7.12.

4.6.19.3 Logical Unit Name attribute

The Logical Unit Name attribute identifies a name (see 3.1.70) for a logical unit that is not a well known logical unit. A logical unit name shall be world wide unique. A logical unit name shall never change and may be used for persistent identification of a logical unit.

Logical unit name(s) are required as follows:

- a) one or more logical unit names if the logical unit is not a well-known logical unit; or
- b) zero logical unit names if the logical unit is a well-known logical unit.

The name used to identify the logical unit is the logical unit name designation descriptor in the Device Identification VPD page (see SPC-4).

4.6.19.4 Dependent Logical Unit attribute

The Dependent Logical Unit attribute identifies a logical unit that is addressed via a hierarchical logical unit that resides at a lower numbered level in the hierarchy (i.e., no logical unit within level 1 contains a Dependent Logical Unit attribute while all logical units within level 2, level 3, and level 4 do contain a Dependent Logical Unit attribute).

Any instance of a Logical Unit class that contains Dependent Logical Unit attribute shall utilize the hierarchical LUN structure defined in 4.7.6. If any logical unit within a SCSI target device includes Dependent Logical Unit attribute:

- a) all logical units within the SCSI target device shall format all LUNs as described in 4.7.6; and

- b) LUN zero or the REPORT LUNS well-known logical unit (see SPC-4) shall set the HiSUP bit to one in the standard INQUIRY data.

4.6.20 Device Server class

The Device Server class (see figure 20) processes the:

- a) Data-In Delivered operation (see 5.4.3.2.2) to determine when data requested to be sent has been sent;
- b) Data-Out Received operation (see 5.4.3.3.2) to determine when data requested to be received has been received;
- c) Data Transfer Terminated operation (see 5.4.3.4.2) to determine when a requested termination of a data transfer has been terminated; and
- d) commands.

4.6.21 Task Manager class

The Task Manager class (see figure 20) processes the:

- a) SCSI Command Received operation (see 5.4.2.3) to determine when a command has been received;
- b) Place Command operation to place a command into a task set;
- a) Control Sequencing operation to control the sequencing of one or more commands within a logical unit;
- b) Task Management Request Received operation (see 7.12.3) to determine when a task management function has been received; and
- c) task management functions.

4.6.22 Task Set class

The Task Set class (see figure 20) contains the Task class (see 4.6.23).

Each instance of a Task Set class shall contain zero or more command objects.

The interactions among the commands in a task set are determined by the requirements for task set management specified in clause 8 and the ACA requirements specified in 5.8. The number of task sets per logical unit and the boundaries between task sets are governed by the TST field in the Control mode page (see SPC-4).

4.6.23 Command class

4.6.23.1 Command class overview

The Command class (see figure 20) represents a request to a logical unit to do work.

The command persists until a **Send Command Complete** SCSI transport protocol service response is sent or until the command is completed by a task management function or an exception condition. For an example of the processing for a command see 5.7.

4.6.23.2 I_T_L_Q Nexus attribute

The I_T_L_Q Nexus attribute contains the I_T_L_Q nexus of the command (see 4.8).

4.6.23.3 Task Attribute attribute

A Task Attribute attribute (see 8.6) contains the task attribute (e.g., SIMPLE task attribute, ORDERED task attribute, HEAD OF QUEUE task attribute, ACA task attribute) of a command.

4.6.23.4 CDB attribute

The CDB attribute contains a CDB (see 5.2 and SPC-4) that defines the work to be performed by a logical unit.

4.6.23.5 CRN attribute

The CRN attribute, if any, contains the CRN of the command (see 5.4.2.2).

4.6.23.6 Command Priority attribute

The Command Priority attribute, if any, contains the priority of the command (see 8.7).

4.6.23.7 Status attribute

The Status attribute contains the status for the completed command (see 5.3).

4.6.23.8 Sense Data attribute

The Sense Data attribute, if any, contains the sense data for the completed command (see 5.4.2.5).

4.6.23.9 Sense Data Length attribute

The Sense Data Length attribute, if any, contains the length of the sense data for the completed command (see 5.4.2.5).

4.6.23.10 Service Response attribute

The Service Response attribute, if any, contains the service response for the completed command (see 5.4.2.5).

4.6.23.11 Status Qualifier attribute

The Status Qualifier attribute, if any, contains additional status information for the completed command (see 5.3.2 and 5.4.2.5).

4.6.23.12 First Burst Enabled attribute

The First Burst Enabled attribute, if any, specifies that first burst for the command is enabled (see 5.4.2.5).

4.6.23.13 Device Server Buffer attribute

The Device Server Buffer attribute, if any, contains the Device Server Buffer argument used for Send Data-In procedure calls (see 5.4.3.2.1) and Receive Data-Out procedure calls (see 5.4.3.3.1).

4.6.23.14 Application Client Buffer Offset attribute

The Application Client Buffer Offset attribute contains the Application Client Buffer Offset argument used for Send Data-In procedure calls (see 5.4.3.2.1) and Receive Data-Out procedure calls (see 5.4.3.3.1).

4.6.23.15 Request Byte Count attribute

The Request Byte Count attribute contains the Request Byte Count argument used for Send Data-In procedure calls (see 5.4.3.2.1) and Receive Data-Out procedure calls (see 5.4.3.3.1).

4.6.23.16 Delivery Result attribute

The Delivery Result attribute contains the Delivery Result argument from a Data-In Delivered procedure call (see 5.4.3.2.1) or a Data-Out Received procedure call (see 5.4.3.3.1).

4.6.24 Task Management Function class

4.6.24.1 Task Management Function class overview

The Task Management Function class (see figure 20) represents a SCSI task management function (see clause 7).

4.6.24.2 Function Identifier attribute

The Function Identifier attribute contains the function identifier (see clause 7).

4.6.24.3 Nexus attribute

The Nexus attribute identifies the nexus affected by the task management function (see 4.8).

4.6.24.4 Service Response attribute

The Service Response attribute contains the service response (see 7.12.4).

4.6.24.5 Additional Response Information attribute

The Additional Response Information attribute, if any, contains any additional response information for the task management function (see clause 7).

4.6.25 Well Known Logical Unit class

The Well Known Logical Unit class (see figure 20) is a Logical Unit class (see 4.6.19.1) with the additional characteristics defined in this subclause.

Well known logical units are addressed using the well known logical unit addressing method (see 4.7.11) of extended logical unit addressing (see 4.7.10). Each well known logical unit has a well known logical unit number (W-LUN). W-LUN values are defined in SPC-4.

If a SCSI target port receives a command or a task management function specifying a W-LUN and the well known logical unit specified by the W-LUN does not exist, the task router shall follow the rules for addressing an incorrect logical unit described in 5.11 and 7.12.

A well known logical unit shall support all the commands defined for it.

Access to well known logical units shall not be affected by access controls.

All well known logical units:

- a) shall not have logical unit names; and
- b) shall identify themselves using the SCSI device names of the SCSI device in which they are contained.

NOTE 6 A SCSI target device may have multiple SCSI device names if the SCSI target device supports multiple SCSI transport protocols (see 4.6.14).

The name used to identify the well known logical unit is the SCSI target device name designation descriptor in the Device Identification VPD page (see SPC-4).

4.7 Logical unit number (LUN)

4.7.1 Introduction

Subclause 4.7 defines the construction of LUNs to be used by SCSI target devices. Application clients should use only those LUNs returned by a REPORT LUNS command. The task router shall respond to LUNs other than those returned by a REPORT LUNS command (i.e., incorrect logical unit numbers) as specified in 5.11 and 7.12.

4.7.2 Logical unit representation format

When an application client displays or otherwise makes a 64-bit LUN value visible, the application client should display it in hexadecimal format with byte 0 first (i.e., on the left) and byte 7 last (i.e., on the right), regardless of the internal representation of the LUN value (e.g., a single level LUN with an ADDRESS METHOD field set to 01b (i.e., flat space addressing) and a FLAT SPACE LUN field set to 0001h should be displayed as 40 01 00 00 00 00 00 00h, not 00 00 00 00 00 00 01 40h). A separator (e.g., space, dash, or colon) may be included between each byte, each two bytes (e.g., 4001-0000-0000-0000h), or each four bytes (e.g., 40010000 00000000h).

When displaying a single level 64-bit LUN value, an application client may display the value as a single 2-byte value representing only the first level LUN (e.g., 40 01h). A separator (e.g., space, dash, or colon) may be included between each byte.

When displaying a 16-bit LUN value, an application client should display the value as a single 2-byte value (e.g., 40 01h). A separator (e.g., space, dash, or colon) may be included between each byte.

4.7.3 LUNs overview

All LUN formats described in this standard are hierarchical in structure even when only a single level in that hierarchy is used. The HISUP bit shall be set to one in the standard INQUIRY data (see SPC-4) when any LUN format described in this standard is used. Non-hierarchical formats are outside the scope of this standard.

A LUN shall contain 64 bits or 16 bits, with the size being defined by the SCSI transport protocol. For SCSI transport protocols that define 16-bit LUNs, the two bytes shall be formatted as described for the FIRST LEVEL ADDRESSING field (see table 15 in 4.7.6).

4.7.4 Minimum LUN addressing requirements

All SCSI target devices shall support LUN 0 (i.e., 00000000 00000000h) or the REPORT LUNS well-known logical unit. For SCSI target devices that support the hierarchical addressing model the LUN 0 or the REPORT LUNS well-known logical unit shall be the logical unit that an application client addresses to determine information about the SCSI target device and the logical units contained within the SCSI target device.

The responses to commands sent to unsupported logical units are defined in 5.11. The response to task management functions sent to unsupported logical units is defined in 7.1.

Table 11 describes a single level subset of the format described in 4.7.6 for SCSI target devices that contain 256 or fewer logical units.

Table 11 — Single level LUN structure using peripheral device addressing method

Bit Byte	7	6	5	4	3	2	1	0
0	ADDRESS METHOD (00b)		BUS IDENTIFIER (00h)					
1	TARGET OR LUN							
2	Null second level LUN (0000h)							
3								
4	Null third level LUN (0000h)							
5								
6	Null fourth level LUN (0000h)							
7								

Byte 2 through byte 7 in an 8-byte single level LUN structure using the peripheral device addressing method shall contain 00h (see table 11). The value in the TARGET OR LUN field shall address a single level logical unit and be between 0 and 255, inclusive. A value of 00h in the ADDRESS METHOD field specifies peripheral device addressing (see 4.7.6). A value of 00h in the BUS IDENTIFIER field specifies the current level (see 4.7.7).

Table 12 describes a single level subset of the format described in 4.7.6 for SCSI target devices that contain 16 384 or fewer logical units.

Table 12 — Single Level LUN structure using flat space addressing method

Bit Byte	7	6	5	4	3	2	1	0
0	ADDRESS METHOD (01b)		(MSB)					
1	FLAT SPACE LUN						(LSB)	
2	Null second level LUN (0000h)							
3								
4	Null third level LUN (0000h)							
5								
6	Null fourth level LUN (0000h)							
7								

Byte 2 through byte 7 in an 8-byte single level LUN structure using the flat space addressing method shall contain 00h (see table 12). The value in the FLAT SPACE LUN field shall be between 0 and 16 383, inclusive. A value of 01b in the ADDRESS METHOD field specifies flat space addressing (see 4.7.8) at the current level.

Table 13 describes a single level subset of the format described in 4.7.6 for SCSI target devices that contain more than 16 384 logical units.

Table 13 — Single level LUN structure using extended flat space addressing method

Bit Byte	7	6	5	4	3	2	1	0
0	ADDRESS METHOD (11b)		LENGTH (01b)		EXTENDED ADDRESS METHOD (2h)			
1	(MSB)							
3	EXTENDED FLAT SPACE ADDRESS							(LSB)
4	Null second level LUN (0000h)							
5								
6	Null third level LUN (0000h)							
7								

Byte 4 through byte 11 in an 12-byte single level LUN structure using the extended flat space addressing method shall contain 00h (see table 13). The value in the EXTENDED FLAT SPACE ADDRESS field shall be between 0 and 16 777 215, inclusive. A value of 11b in the ADDRESS METHOD field with a value of 2h in the EXTENDED ADDRESS METHOD field specifies extended flat space addressing (see 4.7.12) at the current level. A value of 01b in the LENGTH field specifies that the LUN specified in the EXTENDED FLAT SPACE ADDRESS field is three bytes in length.

The presence of well-known logical units shall not affect the requirements defined within this subclause.

If a SCSI target device contains 256 or fewer logical units, none of which are dependent logical units (see 4.6.19.4), then the SCSI target device's LUNs:

- a) should have the format shown in table 11 (i.e., peripheral device addressing);
- b) may have the format shown in table 12 (i.e., flat space addressing); or
- c) may have the format shown in table 13 (i.e., extended flat space addressing).

If a SCSI target device contains more than 256 logical units and 16 384 or fewer logical units, none of which are dependent logical units (see 4.6.19.4), then the SCSI target device's LUNs:

- a) should have the format shown in table 12 (i.e., flat space addressing);
- b) may have the format shown in table 13 (i.e., extended flat space addressing); or
- c) may have the format shown in table 11 (i.e., peripheral device addressing) for up to 256 of the logical units within SCSI target device.

If a SCSI target device contains more than 16 384 logical units, none of which are dependent logical units (see 4.6.19.4), then the SCSI target device's LUNs:

- a) should have the format shown in table 13 (i.e., extended flat space addressing);
- b) may have the format shown in table 12 (i.e., flat space addressing) for up to 16 384 of the logical units within SCSI target device; or
- c) may have the format shown in table 11 (i.e., peripheral device addressing) for up to 256 of the logical units within SCSI target device.

4.7.6 Eight byte LUN structure

The eight byte LUN structure (see table 15) contains four levels of addressing fields. Each level shall use byte 0 and byte 1 to define the address and location of the SCSI target device to be addressed on that level.

If the LUN specifies that the command or task management function is to be relayed to the next level (i.e. peripheral device addressing method (see 4.7.7) is selected in byte 0 and byte 1 of the eight byte LUN structure and the BUS IDENTIFIER field is set to a value greater than zero), then the current level shall use byte 0 and byte 1 of the eight byte LUN structure to determine the address of the SCSI target device to which the command is to be sent. When the command or task management function is sent to the SCSI target device the eight byte LUN structure that was received shall be adjusted to create a new eight byte LUN structure (see table 14 and figure 21).

SCSI target devices shall keep track of the addressing information necessary to transmit information back through all intervening levels to the command's or task management function's originating SCSI initiator port.

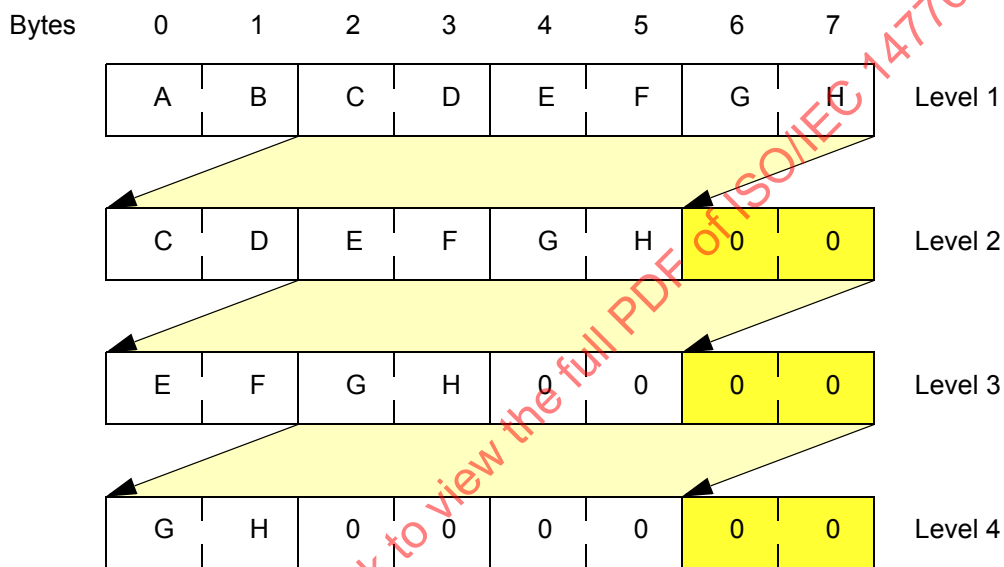

Figure 21 — Eight byte LUN structure adjustments

Table 14 — Eight byte LUN structure adjustments

Byte position		
Old		New
0 & 1	Moves to	Not Used
2 & 3	Moves to	0 & 1
4 & 5	Moves to	2 & 3
6 & 7	Moves to	4 & 5
n/a	zero fill	6 & 7

The eight byte LUN structure requirements as viewed from the application client are shown in table 15.

Table 15 — Eight byte LUN structure

Bit Byte	7	6	5	4	3	2	1	0
0	FIRST LEVEL ADDRESSING (see table 16)							
1								
2	SECOND LEVEL ADDRESSING (see table 16)							
3								
4	THIRD LEVEL ADDRESSING (see table 16)							
5								
6	FOURTH LEVEL ADDRESSING (see table 16)							
7								

The FIRST LEVEL ADDRESSING field specifies the first level address of a SCSI target device. See table 16 for a definition of the FIRST LEVEL ADDRESSING field.

The SECOND LEVEL ADDRESSING field specifies the second level address of a SCSI target device. See table 16 for a definition of the SECOND LEVEL ADDRESSING field.

The THIRD LEVEL ADDRESSING field specifies the third level address of a SCSI target device. See table 16 for a definition of the THIRD LEVEL ADDRESSING field.

The FOURTH LEVEL ADDRESSING field specifies the fourth level address of a SCSI target device. See table 16 for a definition of the FOURTH LEVEL ADDRESSING field.

Table 16 — Format of addressing fields

Bit Byte	7	6	5	4	3	2	1	0
n	ADDRESS METHOD							
n+1	ADDRESS METHOD SPECIFIC							

The ADDRESS METHOD field defines the contents of the ADDRESS METHOD SPECIFIC field. See table 17 for the address methods defined for the ADDRESS METHOD field. The ADDRESS METHOD field only defines address methods for entities that are directly addressable by an application client.

Table 17 — ADDRESS METHOD field

Code	Description	Reference
00b	Peripheral device addressing method	4.7.7
01b	Flat space addressing method	4.7.8
10b	Logical unit addressing method	4.7.9
11b	Extended logical unit addressing method	4.7.10

4.7.7 Peripheral device addressing method

If the peripheral device addressing method (see table 18) is selected, the SCSI target device should relay the received command or task management function to the addressed dependent logical unit.

If the SCSI device does not relay any commands or task management functions to the addressed dependent logical unit, then the SCSI device shall follow the rules for addressing an incorrect logical unit described in 5.11 and 7.12.

If the SCSI device does relay some commands and task management functions to the addressed dependent logical unit, then the SCSI device shall:

- complete any command that is not relayed with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID COMMAND OPERATION CODE; and
- terminate a task management function that is not relayed with a service response of SERVICE DELIVERY OR TARGET FAILURE.

NOTE 7 A SCSI device may filter (i.e., not relay) commands or task management functions to prevent operations with deleterious effects from reaching a dependent logical unit (e.g., a WRITE command directed to a logical unit that is participating in a RAID volume).

Table 18 — Peripheral device addressing format

Bit Byte	7	6	5	4	3	2	1	0
n	ADDRESS METHOD (00b)		BUS IDENTIFIER					
n+1	TARGET OR LUN							

The BUS IDENTIFIER field identifies the bus or path that the SCSI device shall use to relay the received command or task management function. The BUS IDENTIFIER field may use the same value encoding as the BUS NUMBER field (see 4.7.9) with the most significant bits set to zero. However, if the BUS IDENTIFIER field is set to 00h, then the command or task management function is to be relayed to a logical unit within the SCSI target device at the current level.

The TARGET OR LUN field specifies the address of the peripheral device (e.g., a SCSI target device at the next level) to which the SCSI device shall relay the received command or task management function. The meaning and usage of the TARGET OR LUN field depends on whether the BUS IDENTIFIER field contains zero.

A BUS IDENTIFIER field of zero specifies a logical unit at the current level. This representation of a logical unit may be used either when the SCSI target device at the current level does not use hierarchical addressing for

assigning LUNs to entities or when the SCSI target device at the current level includes entities that are assigned LUNs but are not attached to SCSI buses. When the BUS IDENTIFIER field contains zero, the command or task management function shall be relayed to the current level logical unit specified by the TARGET OR LUN field within or joined to the current level SCSI device.

A BUS IDENTIFIER field greater than zero represents a SCSI domain that connects a group of SCSI target devices to the current level SCSI device. Each SCSI domain shall be assigned a unique bus identifier number from 1 to 63. These bus identifiers shall be used in the BUS IDENTIFIER field when assigning addresses to peripheral devices attached to the SCSI domains. When the BUS IDENTIFIER field is greater than zero, the command or task management function shall be relayed to the logical unit within the SCSI target device specified in the TARGET OR LUN field located in the SCSI domain specified by the BUS IDENTIFIER field with the LUN being set to the contents of the received LUN shifted by two bytes as described in 4.7.6. The SCSI target device information in the TARGET OR LUN field is a mapped representation of a target port identifier.

The SCSI target device located within the current level is addressed when the BUS IDENTIFIER field is set to zero and the TARGET OR LUN field is set to zero, also known as LUN 0 (see 4.7.4).

Figure 22 shows the selection of a logical unit using the peripheral device addressing method.

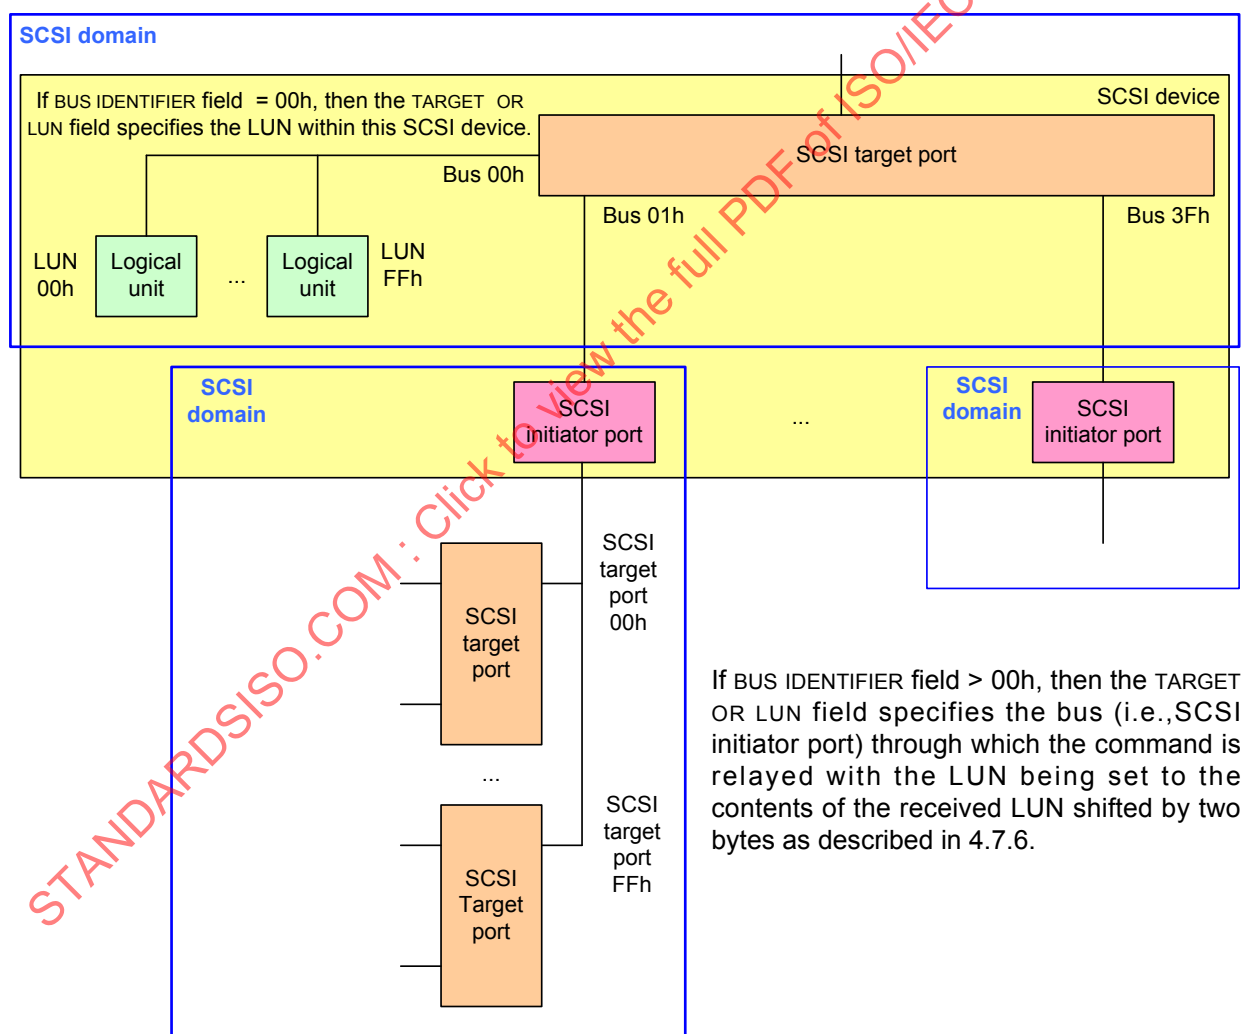

Figure 22 — Logical unit selection using the peripheral device addressing format

4.7.8 Flat space addressing method

The flat space addressing method (see table 19) specifies a logical unit at the current level.

The contents of all hierarchical structure addressing fields following a flat space addressing method addressing field shall be ignored.

Table 19 — Flat space addressing format

Bit Byte	7	6	5	4	3	2	1	0
n	ADDRESS METHOD (01b)		(MSB)					
n+1	FLAT SPACE LUN							(LSB)

The FLAT SPACE LUN field specifies the current level logical unit.

4.7.9 Logical unit addressing method

If the logical unit addressing method (see table 20) is selected, the SCSI device should relay the received command or task management function to the addressed dependent logical unit.

If the SCSI device does not relay any commands or task management functions to the addressed dependent logical unit, then the SCSI device shall follow the rules for addressing an incorrect logical unit described in 5.11 and 7.12.

If the SCSI device does relay some commands and task management functions to the addressed dependent logical unit, then the SCSI device shall:

- complete any command that is not relayed with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID COMMAND OPERATION CODE; and
- terminate a task management function that is not relayed with a service response of SERVICE DELIVERY OR TARGET FAILURE.

NOTE 8 A SCSI device may filter (i.e., not relay) commands or task management functions to prevent operations with deleterious effects from reaching a dependent logical unit (e.g., a WRITE command directed to a logical unit that is participating in a RAID volume).

The contents of all hierarchical structure addressing fields following a logical unit addressing method addressing field shall be ignored.

Table 20 — Logical unit addressing format

Bit Byte	7	6	5	4	3	2	1	0
n	ADDRESS METHOD (10b)		TARGET					
n+1	BUS NUMBER			LUN				

The TARGET field, BUS NUMBER field, and LUN field address the logical unit to which the received command or task management function shall be relayed. The command or task management function shall be relayed to the logical unit specified by the LUN field within the SCSI target device specified by the TARGET field located on the bus specified by the BUS NUMBER field. The value in the LUN field shall be placed in the least significant bits of the TARGET OR LUN field in a single level LUN structure for LUNs 255 and below (see 4.7.5). The TARGET field contains a mapped representation of a target port identifier.

Figure 23 shows the selection of a logical unit using the logical unit addressing method.

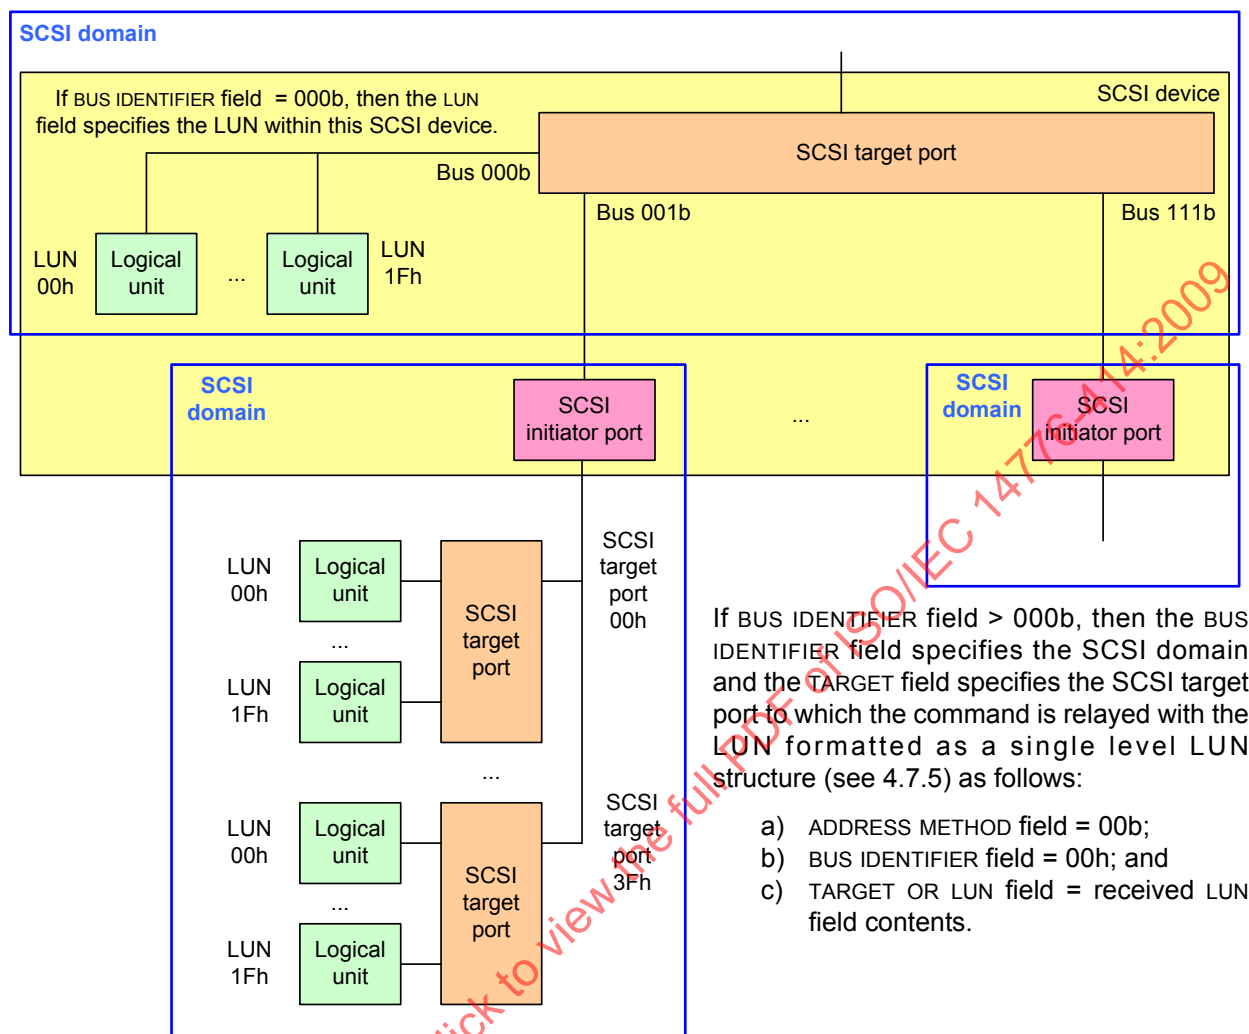

Figure 23 — Logical unit selection using the logical unit addressing format

4.7.10 Extended logical unit addressing

Extended logical unit addressing (see table 21) specifies a logical unit at the current level.

Extended logical unit addressing builds on the formats defined for dependent logical units (see 4.6.19.4) but may be used by SCSI devices having single level logical unit structure. In dependent logical unit addressing, the logical unit information at each level fits in exactly two bytes. Extended logical unit addresses have sizes of two bytes, four bytes, six bytes, or eight bytes.

The contents of all hierarchical structure addressing fields following an extended logical unit addressing method addressing field shall be ignored.

Extended logical units are identified by the ADDRESS METHOD field (see table 17 in 4.7.6) in the same manner as is the case for dependent logical units. An ADDRESS METHOD field value of 11b specifies the extended logical unit addressing method.

Table 21 — Extended logical unit addressing format

Bit Byte	7	6	5	4	3	2	1	0
n	ADDRESS METHOD (11b)		LENGTH		EXTENDED ADDRESS METHOD			
n+1	(MSB)							
m	EXTENDED ADDRESS METHOD SPECIFIC (LSB)							

The LENGTH field (see table 22) specifies the length of the EXTENDED ADDRESS METHOD SPECIFIC field. A LUN that includes a LENGTH field value that goes beyond the LUN field length supported by the transport protocol is invalid shall follow the rules for addressing an incorrect logical unit described in 5.11.

Table 22 — LENGTH field and related sizes

Code	Size in bytes of		Reference
	EXTENDED ADDRESS METHOD SPECIFIC field	Extended logical unit addressing format	
00b	1	2	table 23
01b	3	4	table 24
10b	5	6	table 25
11b	7	8	table 26

Table 23, table 24, table 25, and table 26 show the four extended logical unit addressing formats.

Table 23 — Two byte extended logical unit addressing format

Bit Byte	7	6	5	4	3	2	1	0
n	ADDRESS METHOD (11b)		LENGTH (00b)		EXTENDED ADDRESS METHOD			
n+1	EXTENDED ADDRESS METHOD SPECIFIC							

The EXTENDED ADDRESS METHOD field combined with the LENGTH field (see table 27) specifies the type and size of extended logical unit address found in the EXTENDED ADDRESS METHOD SPECIFIC field.

Table 27 — Logical unit extended addressing

EXTENDED ADDRESS METHOD Code(s)	LENGTH Code(s)	Description	Reference
0h	00b - 11b	Reserved	
1h	00b	Well known logical unit	4.7.11
1h	01b - 11b	Reserved	
2h	01b	Extended flat space addressing	4.7.12
2h	00b, 10b, 11b	Reserved	
3h - Eh	00b - 11b	Reserved	
Fh	00b - 10b	Reserved	
Fh	11b	Logical unit not specified	4.7.13

4.7.11 Well known logical unit addressing

A SCSI target device may support zero or more well known logical units (see 4.6.25). A single SCSI target device shall only support one instance of each supported well known logical unit. All well known logical units within a SCSI target device shall be accessible from all SCSI target ports contained within the SCSI target device.

Well known logical units are addressed using the well known logical unit extended address format (see table 28).

Table 28 — Well known logical unit extended addressing format

Bit Byte	7	6	5	4	3	2	1	0
n	ADDRESS METHOD (11b)		LENGTH (00b)		EXTENDED ADDRESS METHOD (1h)			
n+1	W-LUN							

The W-LUN field specifies the well known logical unit to be addressed (see SPC-4).

4.7.12 Extended flat space addressing method

The extended flat space addressing method (see table 29) specifies a logical unit at the current level.

The contents of all hierarchical structure addressing fields following a flat space addressing method addressing field shall be ignored.

Table 29 — Extended flat space addressing format

Bit Byte	7	6	5	4	3	2	1	0
n	ADDRESS METHOD (11b)		LENGTH (01b)		EXTENDED ADDRESS METHOD (2h)			
n+1	(MSB) _____							
n+3	_____ (LSB)							

The EXTENDED FLAT SPACE LUN field specifies a current level logical unit.

4.7.13 Logical unit not specified addressing

Logical unit not specified addressing (see table 30) shall be used to indicate that no logical unit of any kind is specified.

Table 30 — Logical unit not specified extended addressing format

Bit Byte	7	6	5	4	3	2	1	0
0	ADDRESS METHOD (11b)		LENGTH (11b)		EXTENDED ADDRESS METHOD (Fh)			
1	FFh							
2								
7	Ignore							

4.8 Nexus

4.8.1 Nexus overview

The nexus represents a relationship between a SCSI initiator port, a SCSI target port, optionally a logical unit, and optionally a command. The notations for the types of nexuses are:

- I_T nexus;
- I_T_L nexus;
- I_T_L_Q nexus; and
- I_T_L_x nexus.

Table 31 defines the types of nexuses and the identifiers used to construct each of them.

Table 31 — Nexus

Nexus ^a	Identifiers used to construct nexuses	Reference
I_T nexus	Initiator port identifier Target port identifier	4.6.7.2 4.6.6.2
I_T_L nexus	Initiator port identifier Target port identifier LUN	4.6.7.2 4.6.6.2 4.6.19.2
I_T_L_Q nexus	Initiator port identifier Target port identifier LUN Command identifier	4.6.7.2 4.6.6.2 4.6.19.2 4.8.2
^a I_T_L_x nexus specifies either an I_T_L nexus or an I_T_L_Q nexus.		

4.8.2 Command identifier

A command identifier (i.e., the Q in an I_T_L_Q nexus) is assigned by a SCSI initiator device to uniquely identify one command in the context of a particular I_T_L nexus, allowing more than one command to be outstanding for that I_T_L nexus at the same time. Each SCSI transport protocol defines the size of the command identifier, up to a maximum of 64 bytes, to be used by SCSI ports that support that SCSI transport protocol.

SCSI transport protocols may define additional restrictions on command identifier assignments (e.g., requiring command identifiers to be unique per I_T nexus or per I_T_L nexus, or sharing command identifier values with other uses such as task management functions).

4.8.3 Nexus usage rules

An I_T_L_Q nexus that is in use (i.e., during the interval bounded by the events specified in 5.5) shall be unique as seen by the SCSI initiator port originating the command and the logical unit to which the command was addressed, otherwise an overlapped command condition exists (see 5.10). An I_T_L_Q nexus is unique if one or more of its components is unique within the specified time interval.

The SCSI initiator device shall not create more than one command from a specific SCSI initiator port having identical values for the target port identifier, LUN, and command identifier.

4.9 SCSI ports

4.9.1 SCSI port configurations

A SCSI device contains only the following combinations of SCSI ports:

- all SCSI target ports;
- all SCSI initiator ports; or
- any combination of SCSI target ports and SCSI initiator ports.

Some of the SCSI port configurations possible for a SCSI device are shown in figure 24.

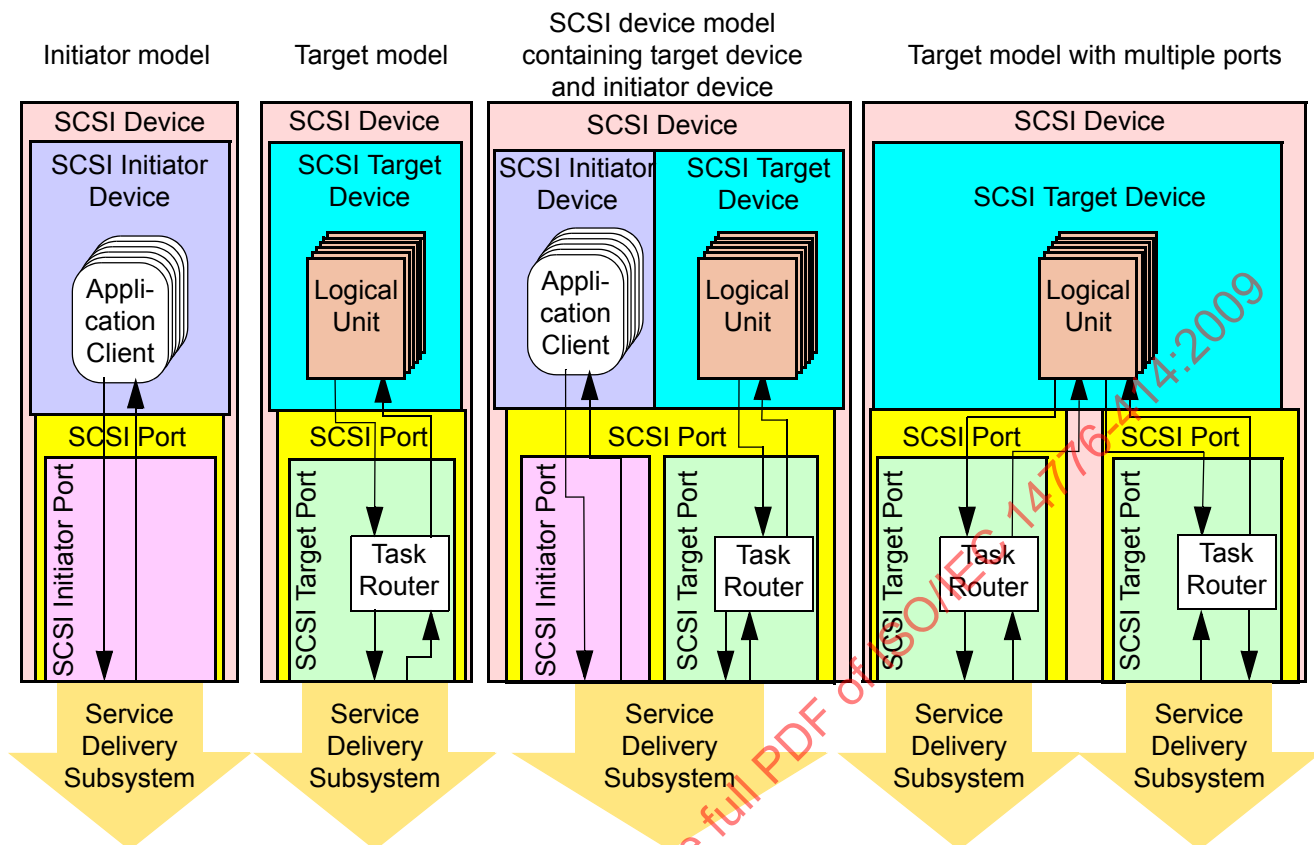

Figure 24 — SCSI device functional models

4.9.2 SCSI devices with multiple ports

The model for a SCSI device with multiple ports is a single:

- SCSI target device (see 4.6.14) with multiple SCSI target ports;
- SCSI initiator device (see 4.6.9) with multiple SCSI initiator ports; or
- SCSI device containing a SCSI initiator device and a SCSI target device, and multiple SCSI ports.

The identifiers representing the SCSI ports shall meet the requirements for initiator port identifiers (see 4.6.9) or target port identifiers (see 4.6.14). How a multiple port SCSI device is viewed by counterpart SCSI devices in the SCSI domain also depends on whether a SCSI initiator port is examining a SCSI target port, or a SCSI target port is servicing a SCSI initiator port.

4.9.3 Multiple port SCSI target device structure

Figure 25 shows the structure of a SCSI target device with multiple SCSI ports each containing a SCSI target port. Each SCSI target port contains a task router that is shared by a collection of logical units. Each logical unit contains a single task manager and a single device server.

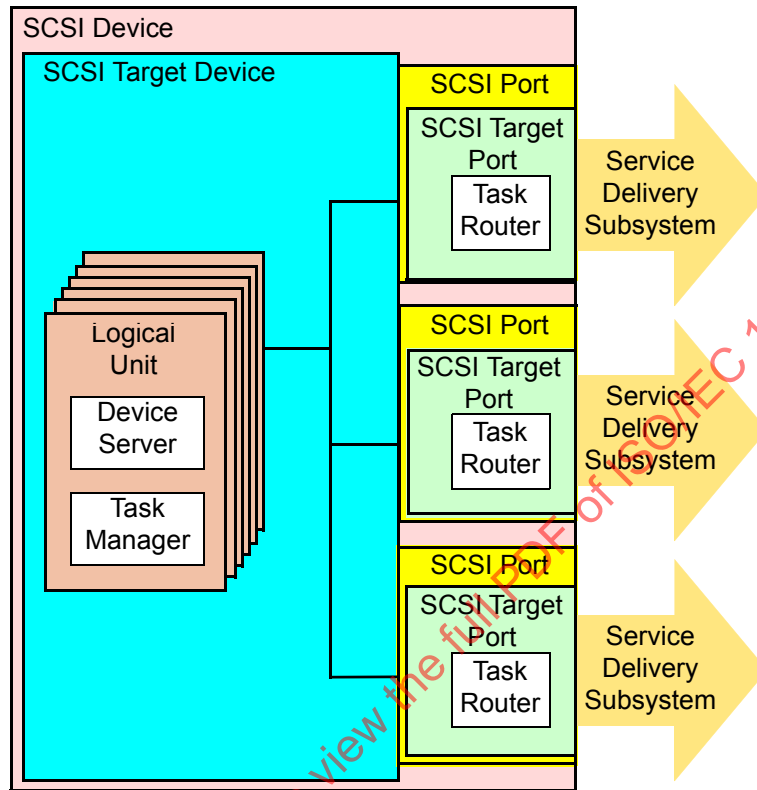

Figure 25 — Multiple port target SCSI device structure model

Two-way communications shall be possible between all logical units and all SCSI target ports in a SCSI device. However, communications between any logical unit and any SCSI target port in a SCSI device may be inactive. Two-way communications shall be available between each task manager and all task routers in the SCSI target ports in the SCSI device. Each SCSI target port in a SCSI device shall accept commands sent to LUN 0 or the REPORT LUNS well-known logical unit, and the task router in that SCSI target port shall route the commands to a device server in a logical unit in the SCSI device for processing. REPORT LUNS commands (see SPC-4) shall be accepted by the logical unit with the LUN zero or the REPORT LUNS well-known logical unit from any SCSI target port in the SCSI device, and the logical unit shall return the logical unit inventory available via that SCSI target port. An application client determines the availability of the same logical unit through multiple SCSI target ports in a SCSI device by matching logical unit name values in the Device Identification VPD page (see SPC-4).

4.9.4 Multiple port SCSI initiator device structure

Figure 26 shows the structure of a SCSI initiator device with multiple SCSI ports each containing a SCSI initiator port. Each SCSI initiator port is shared by a collection of application clients.

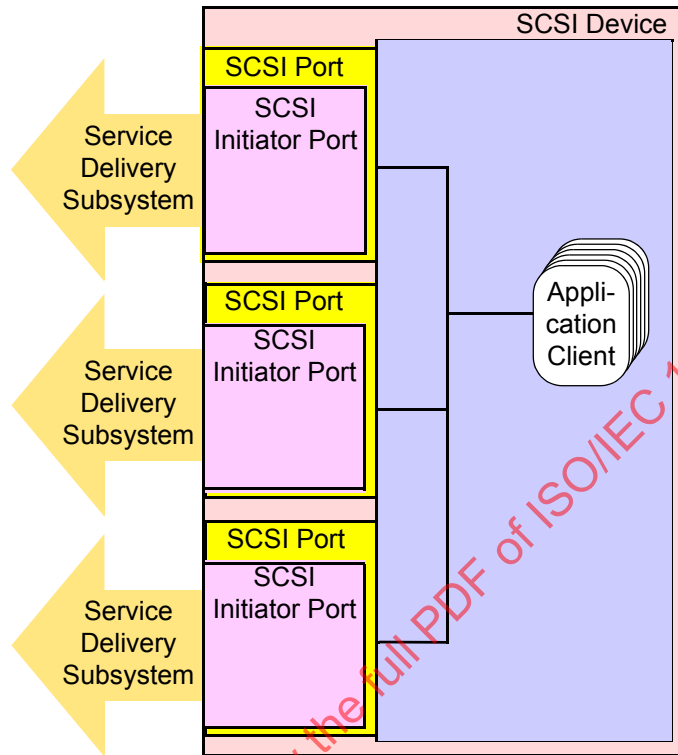

Figure 26 — Multiple port SCSI initiator device structure model

Two-way communications shall be possible between an application client and its associated SCSI initiator port. This standard does not specify or require the definition of any mechanisms by which a SCSI target device would have the ability to discover that it is communicating with multiple ports on a single SCSI initiator device. In those SCSI transport protocols where such mechanisms are defined, they shall not have any effect on how commands are processed (e.g., reservations shall be handled as if no such mechanisms exist).

4.9.5 Multiple port SCSI device structure

Figure 27 shows the structure of a SCSI device containing a SCSI target device and a SCSI initiator device, and multiple SCSI ports. Each SCSI port contains a SCSI target port and a SCSI initiator port. This SCSI device may also contain SCSI ports that only contain a SCSI target port or a SCSI initiator port. Each SCSI port consists of a SCSI target port containing a task router and a SCSI initiator port and is shared by a collection of logical units and application clients. Each logical unit contains a task manager and a device server.

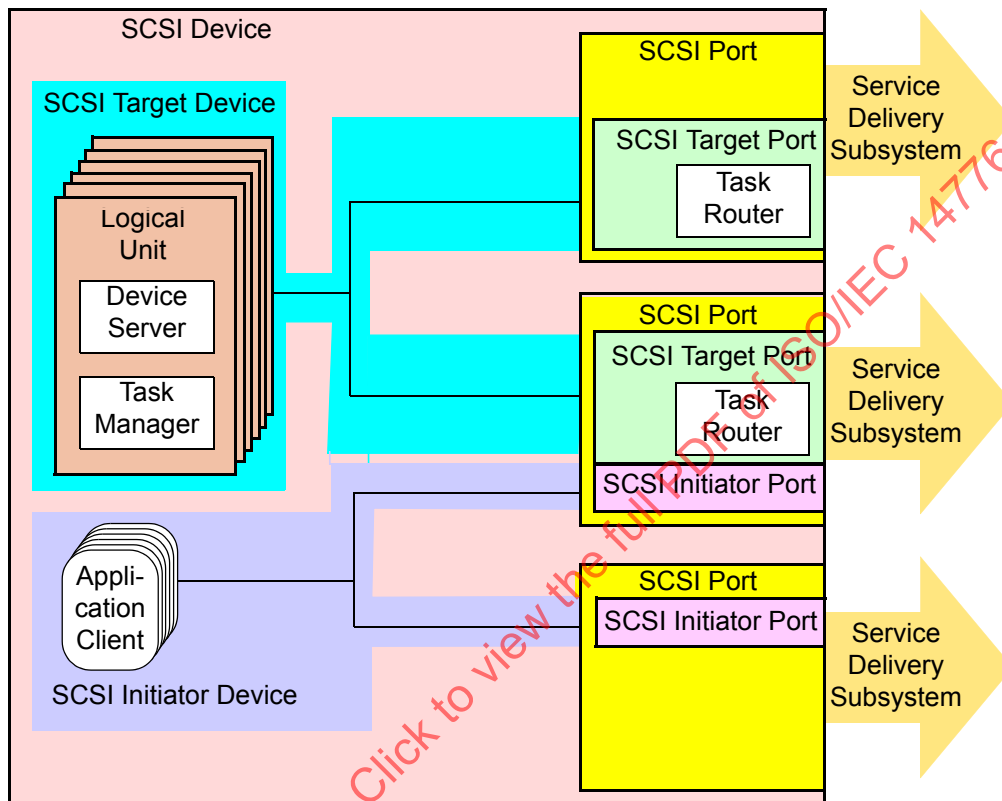

Figure 27 — Multiple port SCSI device structure model

Two-way communications shall be possible between all logical units and all SCSI target ports in a SCSI device. However, communications between any logical unit and any SCSI target port in a SCSI device may be inactive. Two-way communications shall be available between each task manager and all task routers in the SCSI target ports in the SCSI device. Each SCSI target port in a SCSI device shall accept commands sent to LUN 0 or the REPORT LUNS well-known logical unit, and the task router in that SCSI target port shall route the commands to a device server in a logical unit in the SCSI device for processing. REPORT LUNS commands (see SPC-4) shall be accepted by the logical unit with the LUN zero or the REPORT LUNS well-known logical unit from any SCSI target port in the SCSI device, and the logical unit shall return the logical unit inventory available via that SCSI target port. An application client determines the availability of the same logical unit through multiple SCSI target ports in a SCSI device by matching logical unit name values in the Device Identification VPD page (see SPC-4).

This standard does not specify or require the definition of any mechanisms by which a SCSI target device would have the ability to discover that it is communicating with multiple SCSI ports that also contain a SCSI initiator port on a single SCSI device. In those SCSI transport protocols where such mechanisms are defined, they shall not have any effect on how commands are processed (e.g., reservations shall be handled as if no such mechanisms exist).

4.9.6 SCSI initiator device view of a multiple port SCSI target device

A SCSI target device may have SCSI target ports connected to different SCSI domains such that a SCSI initiator port is only able to communicate with the logical units in the SCSI target device using the SCSI target ports in a single SCSI domain. However, SCSI target devices with multiple SCSI ports may be configured where application clients have the ability to discover that one or more logical units are accessible via multiple SCSI target ports. Figure 28 and figure 29 show two examples of such configurations.

Figure 28 shows a SCSI target device with multiple SCSI ports each containing a SCSI target port participating in a single SCSI domain with two SCSI initiator devices. There are three SCSI devices, one of which has two SCSI target ports, and two of which have one SCSI initiator port each. There are two target port identifiers and two initiator port identifiers in this SCSI domain. Using the INQUIRY command Device Identification VPD page (see SPC-4), the application clients in each of the SCSI initiator devices have the ability to discover if the logical units in the SCSI target devices are accessible via multiple SCSI target ports and map the configuration of the SCSI target device.

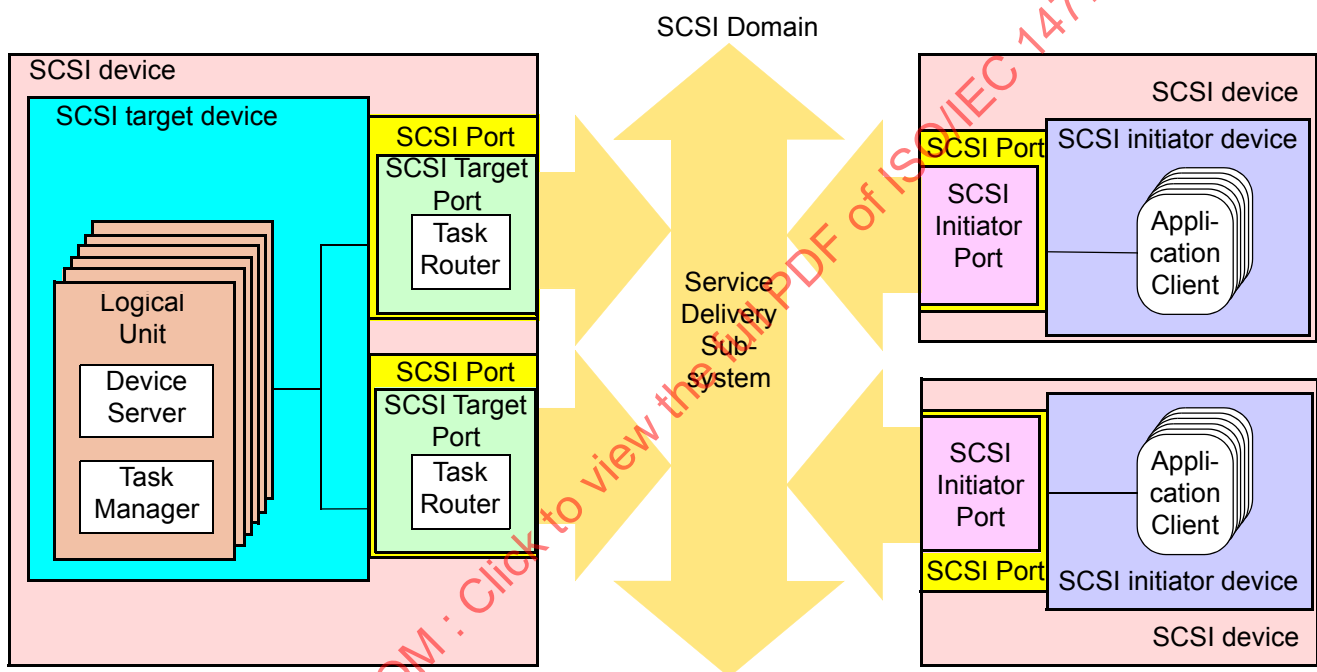

Figure 28 — SCSI target device configured in a single SCSI domain

Figure 29 shows a SCSI target device with multiple SCSI ports each containing a SCSI target port participating in two SCSI domains and a SCSI initiator device with multiple SCSI ports each containing a SCSI initiator port participating in the same two SCSI domains. There is one SCSI target device with two SCSI target ports and one SCSI initiator device with two SCSI initiator ports. There is one target port identifier and one initiator port identifier in each of the two SCSI domains. Using the INQUIRY command Device Identification VPD page (see SPC-4), the application clients in the SCSI initiator device have the ability to discover that logical units in the SCSI target device are accessible via multiple SCSI initiator ports and multiple SCSI target ports and map the configuration. However, application clients may not be able to distinguish between the configuration shown in figure 29 and the configuration shown in figure 30.

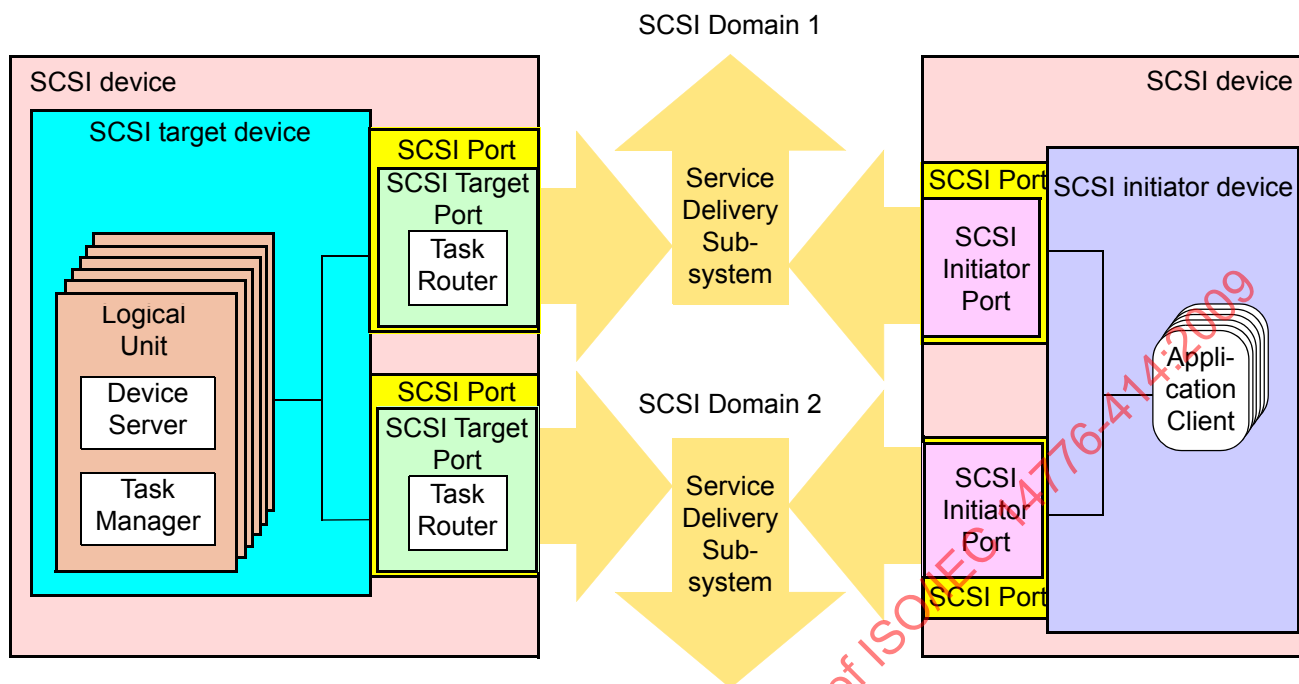

Figure 29 — SCSI target device configured in multiple SCSI domains

Figure 30 shows the same configuration as figure 29 except that the two SCSI domains have been replaced by a single SCSI domain.

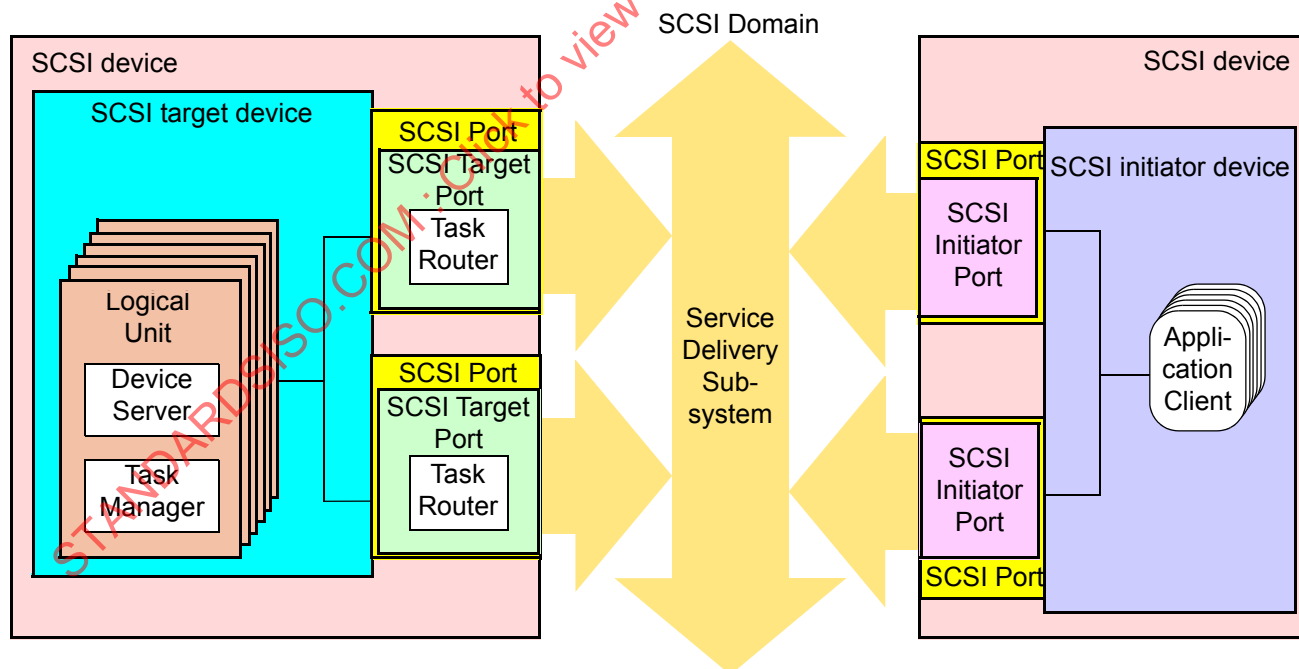

Figure 30 — SCSI target device and SCSI initiator device configured in a single SCSI domain

This model for application client determination of multiple SCSI target port configurations relies on information that is available only to the application clients via commands.

4.9.7 SCSI target device view of a multiple port SCSI initiator device

This standard does not require a SCSI target device to be able to detect that a SCSI initiator device contains more than one SCSI initiator port. In the cases where a SCSI target device does not detect that a SCSI initiator device contains more than one SCSI initiator port, the SCSI target device interacts with the SCSI initiator device as if each SCSI initiator port was contained in a separate SCSI initiator device (e.g., a SCSI target device operates in the configurations shown in figure 29 and figure 30 in the same way it operates in the configuration shown in figure 28).

NOTE 9 The implications of this view of a SCSI initiator device are more far reaching than are immediately apparent (e.g., after a SCSI initiator device makes a persistent exclusive access reservation via one SCSI initiator port, access is denied to the other SCSI initiator port(s) on that same SCSI initiator device).

4.10 The SCSI model for distributed communications

The SCSI model for communications between distributed objects is based on the technique of layering as shown in figure 31.

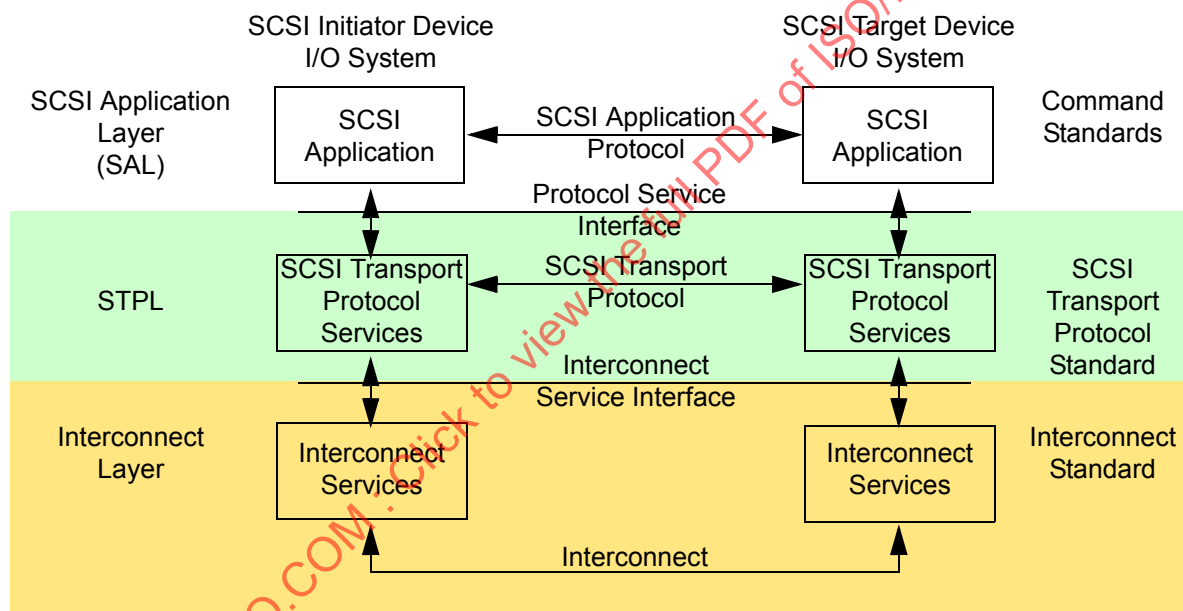

Figure 31 — Protocol service reference model

The layers in this model and the specifications defining the functionality of each layer are denoted by horizontal sequences. A layer consists of peer entities that communicate with one another by means of a protocol. Except for the interconnect layer, such communication is accomplished by invoking services provided by the adjacent layer. The following layers are defined:

- SAL:** Clients and servers that originate and process SCSI I/O operations by means of a SCSI application protocol;
- STPL:** Services and protocols through which clients and servers communicate; and
- Interconnect layer:** Services, signaling mechanism and interconnect subsystem used for the physical transfer of data from sender to receiver. In the SCSI model, the interconnect layer is known as a service delivery subsystem.

The set of SCSI transport protocol services implemented by a service delivery subsystem identify external behavioral requirements that apply to SCSI transport protocol standards. While these SCSI transport protocol services may serve as a guide for designing reusable software or firmware that is adaptable to different SCSI transport protocols, there is no requirement for an implementation to provide the service interfaces specified in this standard.

The SCSI transport protocol service interface is defined in this standard in representational terms using SCSI transport protocol services. The SCSI transport protocol service interface implementation is defined in each SCSI transport protocol standard. The interconnect service interface is described as appropriate in each SCSI transport protocol standard.

Interactions between the SAL and STPL are defined with respect to the SAL and may originate in either layer. An outgoing interaction is modeled as a procedure call invoking an STPL service. An incoming interaction is modeled as a procedure call invoked by the STPL.

All procedure calls may be accompanied by parameters or data. Both types of interaction are described using the notation for procedures specified in 3.6.2. In this standard, input arguments are defined relative to the layer receiving an interaction (i.e., an input is a argument supplied to the receiving layer by the layer initiating the interaction).

The following types of service interactions between layers are defined:

- SCSI transport protocol service request procedure calls from the SAL invoking a service provided by the STPL;
- SCSI transport protocol service indication procedure calls from the STPL informing the SAL that an asynchronous event has occurred (e.g., the receipt of a peer-to-peer protocol transaction);
- SCSI transport protocol service response procedure calls to the STPL invoked by the SAL in response to a SCSI transport protocol service indication. A SCSI transport protocol service response may be invoked to return a reply from the invoking SAL to the peer SAL; and
- SCSI transport protocol service confirmation procedure calls from the STPL notifying the SAL that a SCSI transport protocol service request has completed, has been terminated, or has failed to transit the interconnect layer. A confirmation may communicate parameters that indicate the completion status of the SCSI transport protocol service request or any other status. A SCSI transport protocol service confirmation may be used to convey a response from the peer SAL.

The services provided by an STPL are either confirmed or unconfirmed. A SAL service request invoking a confirmed service always results in a confirmation from the STPL.

Figure 32 shows the relationships between the four SCSI transport protocol service types.

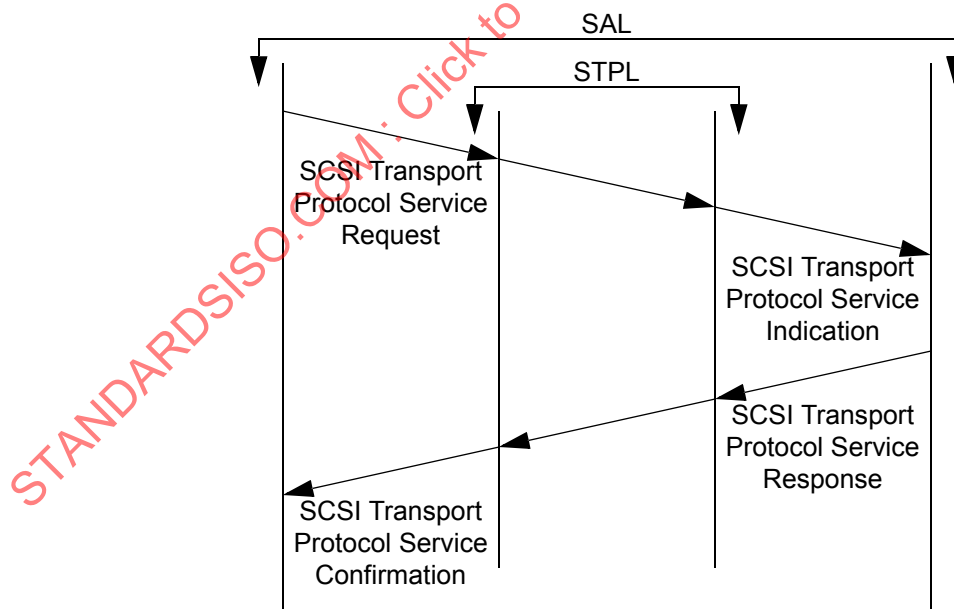

Figure 32 — SCSI transport protocol service mode

Figure 33 shows how SCSI transport protocol services may be used to process a client-server request-response transaction at the SAL.

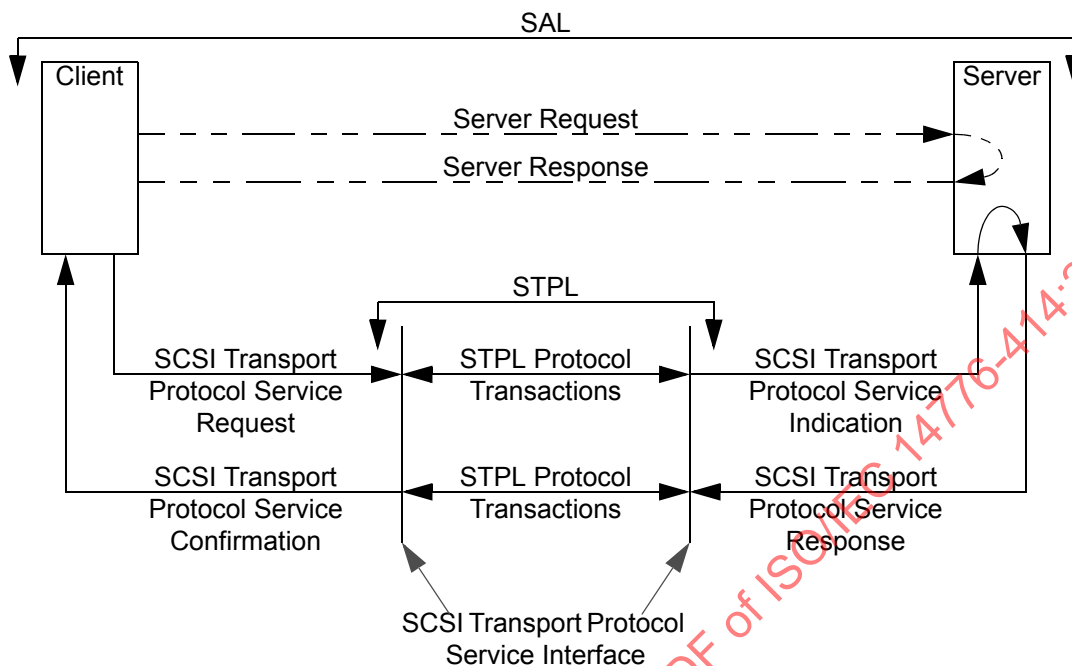

Figure 33 — Request-Response SAL transaction and related STPL services

The dashed lines in figure 33 show a SCSI application protocol transaction as it may appear to sending and receiving entities within the client and server. The solid lines in figure 33 show the corresponding SCSI transport protocol services and STPL transactions that are used to transport the data.

When a device server invokes a data transfer SCSI transport protocol service, the interactions required to transfer the data do not involve the application client. Only the STPL in the SCSI device that also contains the application client is involved. Figure 34 shows the relationships between the SCSI transport protocol service types involved in a data transfer request.

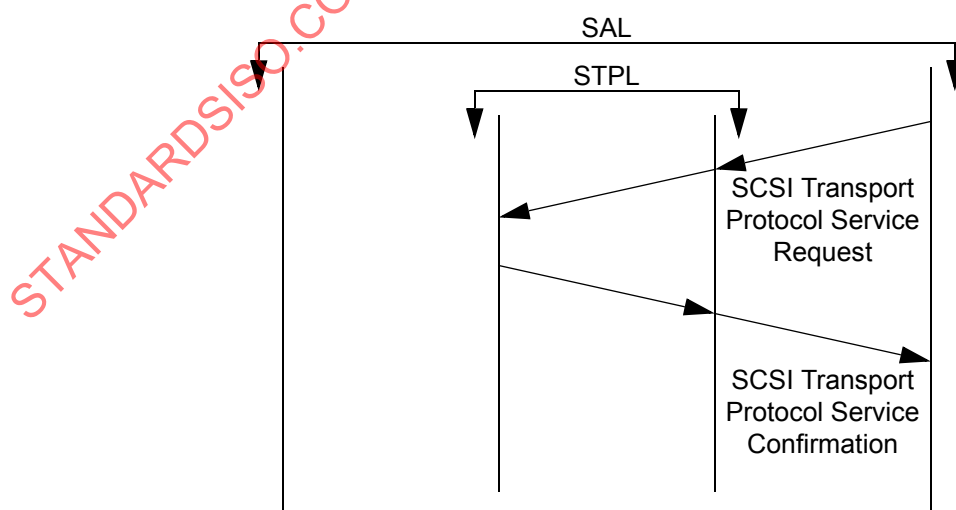

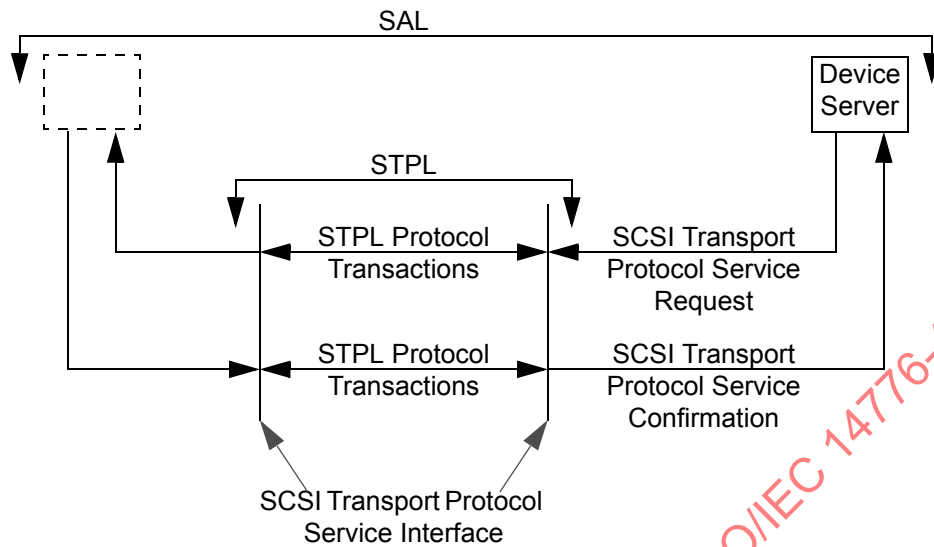

Figure 34 — SCSI transport protocol service model for data transfers

Figure 35 shows how SCSI transport protocol services may be used to process a device server data transfer transaction.

Note: The dotted box represents a memory access function provided by the SCSI initiator device whose definition is outside the scope of this standard.

Figure 35 — Device server data transfer transaction and related STPL services

When a device server invokes a Terminate Data Transfer SCSI transport protocol service, the interactions required to complete the service do not involve the SCSI Transport Protocol Service Interface or the application client. Only the STPL in the SCSI device that also contains the device server is involved. Figure 36 shows the relationships between the SCSI transport protocol service types involved in a Terminate Data Transfer request.

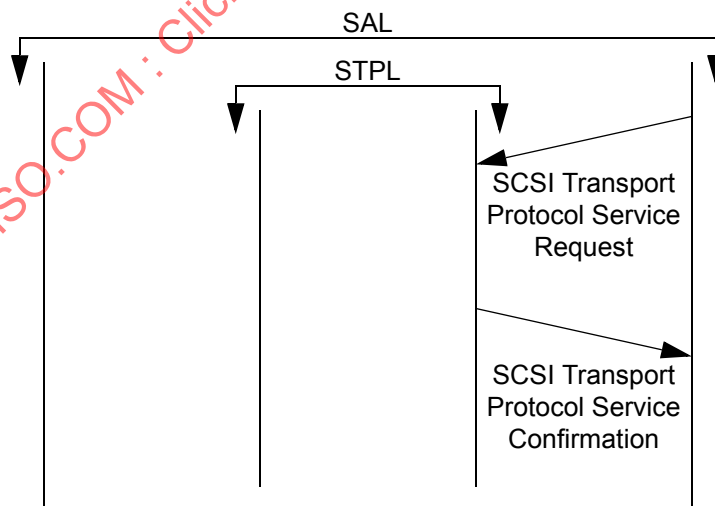

Figure 36 — SCSI transport protocol service model for Terminate Data Transfer

Figure 37 shows how SCSI transport protocol services may be used to process a device server Terminate Data Transfer transaction.

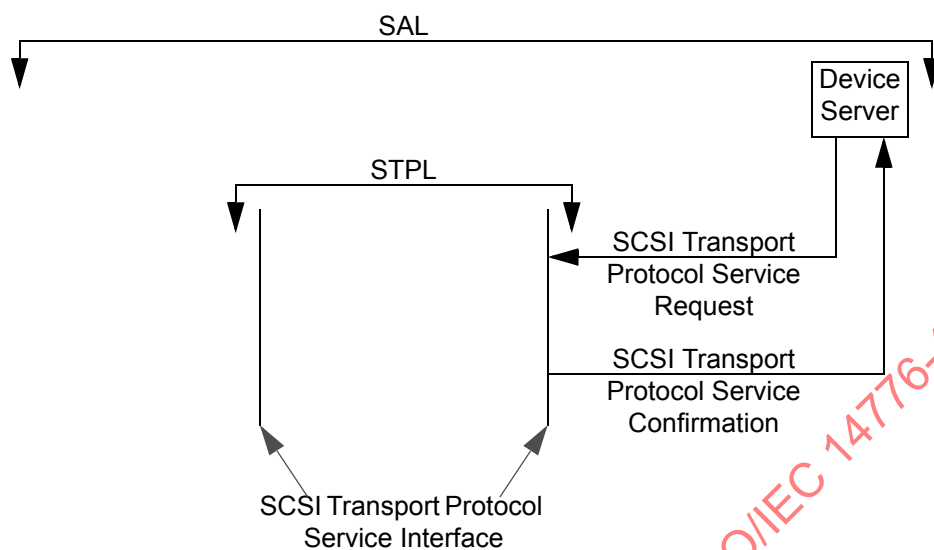

Figure 37 — Device server Terminate Data Transfer transaction and related STPL services

5 SCSI command model

5.1 The Execute Command procedure call

An application client requests the processing of a command by invoking the SCSI transport protocol services described in 5.4, the collective operation of which is modeled in the following procedure call:

Service Response = Execute Command (IN (I_T_L_Q Nexus, CDB, Task Attribute, [Data-In Buffer Size], [Data-Out Buffer], [Data-Out Buffer Size], [CRN], [Command Priority]), OUT ([Data-In Buffer], [Sense Data], [Sense Data Length], Status, [Status Qualifier]))

Input arguments:

I_T_L_Q Nexus: The I_T_L_Q nexus identifying the command (see 4.8).

CDB: Command descriptor block (see 5.2).

Task Attribute: A value specifying one of the task attributes defined in 8.6.

Data-In Buffer Size: The number of bytes available for data transfers to the Data-In Buffer (see 5.4.3). SCSI transport protocols may interpret the Data-In Buffer Size to include both the size and the location of the Data-In Buffer.

Data-Out Buffer: A buffer (see 5.4.3) containing command specific information to be sent to the logical unit (e.g., data or parameter lists needed to process the command). The buffer size is indicated by the Data-Out Buffer Size argument. The content of the buffer shall not change during the lifetime of the command (see 5.5) as viewed by the application client.

Data-Out Buffer Size: The number of bytes available for data transfers from the Data-Out Buffer (see 5.4.3).

CRN: When the CRN is used, all commands on an I_T_L nexus shall include a CRN argument that is incremented by one. The CRN shall be set to one for each I_T_L nexus involving the SCSI port after the SCSI port receives a hard reset or detects I_T nexus loss. The CRN shall be set to one after it reaches the maximum CRN value supported by the protocol. The CRN value zero shall be reserved for use as defined by the SCSI transport protocol. It is not an error for the application client to provide a CRN when CRN is not supported by the SCSI transport protocol or logical unit. See the SCSI transport protocol standards for rules regarding CRN checking.

Command Priority: The priority assigned to the command (see 8.7).

Output arguments:

- Data-In Buffer:** A buffer (see 5.4.3) to contain command specific information returned by the logical unit by the time of command completion. The **Execute Command** procedure call shall not return a GOOD status or CONDITION MET status unless the buffer contents are valid. The application client shall treat the buffer contents as invalid unless **Execute Command** procedure call returns a GOOD status or CONDITION MET status. While some valid data may be present for other values of status, the application client should rely on additional information from the logical unit (e.g., sense data) to determine the state of the buffer contents. If the command terminates with a service response of SERVICE DELIVERY OR TARGET FAILURE, the application client shall consider the buffer to be undefined.
- Sense Data:** A buffer containing sense data returned in the same I_T_L_Q nexus transaction (see 3.1.50) as a CHECK CONDITION status (see 5.13). The buffer length is indicated by the Sense Data Length argument. If the command terminates with a service response of SERVICE DELIVERY OR TARGET FAILURE, the application client shall consider the sense data to be undefined.
- Sense Data Length:** The length in bytes of the Sense Data (see 5.13).
- Status:** A one-byte field containing command completion status (see 5.3). If the command terminates with a service response of SERVICE DELIVERY OR TARGET FAILURE, the application client shall consider command completion status to be undefined.
- Status Qualifier:** Additional information about the indicated command completion status (see 5.3.2).

One of the following SCSI transport protocol specific service responses shall be returned:

- command complete:** A logical unit response indicating that the command has completed. The Status argument shall have one of the values specified in 5.3.
- service delivery or target failure:** The command has been terminated due to a service delivery failure (see 3.1.116) or SCSI target device malfunction. All output arguments are invalid.

The SCSI transport protocol events corresponding to a response of COMMAND COMPLETE or SERVICE DELIVERY OR TARGET FAILURE shall be specified in each SCSI transport protocol standard.

5.2 Command descriptor block (CDB)

The CDB defines the operation to be performed by the device server. See SPC-4 for the CDB formats.

For all commands, if the logical unit detects an invalid field in the CDB, then the logical unit shall not process the command.

All CDBs shall have an OPERATION CODE field as the first byte.

Some operation codes provide for modification of their operation based on a service action. In such cases, the combination of operation code value and service action code value may be modeled as a single, unique command. The location of the SERVICE ACTION field in the CDB varies depending on the operation code value.

All CDBs shall contain a CONTROL byte (see table 32). The location of the CONTROL byte within a CDB depends on the CDB format (see SPC-4).

Table 32 — CONTROL byte

Bit	7	6	5	4	3	2	1	0
	Vendor specific		Reserved			NACA	Obsolete	Obsolete

All SCSI transport protocol standards shall define as mandatory the functionality needed for a logical unit to implement the NACA bit.

The NACA (Normal ACA) bit specifies whether an auto contingent allegiance (ACA) is established if the command terminates with CHECK CONDITION status. A NACA bit set to one specifies that an ACA shall be established. A NACA bit set to zero specifies that an ACA shall not be established. The actions for ACA are specified in 5.9. Actions that may be required when an ACA is not established are described in 5.8. All logical units shall implement support for the NACA value of zero and may support the NACA value of one (i.e., ACA). The ability to support a NACA value of one is indicated with the NORMACA bit in the standard INQUIRY data (see SPC-4).

If the NACA bit is set to one but the logical unit does not support ACA, the command shall be terminated with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST, and the additional sense code set to INVALID FIELD IN CDB.

5.3 Status

5.3.1 Status codes

The status codes are specified in table 33. Status shall be sent from the device server to the application client whenever a command completes with a service response of COMMAND COMPLETE.

Table 33 — Status codes

Code	Status	Command completed	Service response
00h	GOOD	Yes	COMMAND COMPLETE
02h	CHECK CONDITION	Yes	COMMAND COMPLETE
04h	CONDITION MET	Yes	COMMAND COMPLETE
08h	BUSY	Yes	COMMAND COMPLETE
10h	Obsolete		
14h	Obsolete		
18h	RESERVATION CONFLICT	Yes	COMMAND COMPLETE
22h	Obsolete		
28h	TASK SET FULL	Yes	COMMAND COMPLETE
30h	ACA ACTIVE	Yes	COMMAND COMPLETE
40h	TASK ABORTED	Yes	COMMAND COMPLETE
All other codes	Reserved		

Definitions for each status code are as follows:

GOOD. This status indicates that the device server has completed the command without error.

CHECK CONDITION. This status indicates that sense data has been delivered in the buffer defined by the Sense Data argument to the **Execute Command** procedure call (see 5.13). Additional actions that are required when CHECK CONDITION status is returned are described in 5.8.

CONDITION MET. The use of this status is limited to commands for which it is specified (see the PRE-FETCH commands in SBC-3).

BUSY. This status indicates that the logical unit is busy. This status shall be returned whenever a logical unit is temporarily unable to accept a command. The recommended application client recovery action is to issue the command again at a later time.

If the UA_INTLCK_CTRL field in the Control mode page contains 11b (see SPC-4), termination of a command with BUSY status shall cause a unit attention condition to be established for the SCSI initiator port on the L_T nexus that sent the command with an additional sense code set to PREVIOUS BUSY STATUS.

The status qualifier, when supported by a SCSI transport protocol, may provide the SCSI initiator port with more information about when the command should be retransmitted (see 5.3.2).

RESERVATION CONFLICT. This status shall be returned whenever a command is sent by an application client to a logical unit in a way that conflicts with an existing reservation. (See the PERSISTENT RESERVE OUT command and PERSISTENT RESERVE IN command in SPC-4.)

If the UA_INTLCK_CTRL field in the Control mode page contains 11b (see SPC-4), termination of a command with RESERVATION CONFLICT status shall cause a unit attention condition to be established for the SCSI initiator port on the I_T nexus that sent the command with an additional sense code set to PREVIOUS RESERVATION CONFLICT STATUS.

TASK SET FULL. When the logical unit has at least one command in the task set for an I_T nexus and a lack of task set resources prevents the logical unit from accepting an additional command received from that I_T nexus into the task set, TASK SET FULL status shall be returned. When the logical unit has no command in the task set for an I_T nexus and a lack of task set resources prevents accepting a received command from that I_T nexus into the task set, BUSY status should be returned.

The logical unit should allow at least one command in the task set for each supported I_T nexus (i.e., a logical unit should allow at least one command into the task set for each I_T nexus that has been identified in a SCSI transport protocol specific manner (e.g., a login), or by the successful reception of a command).

The status qualifier, when supported by a SCSI transport protocol, may provide the SCSI initiator port with more information about when the command should be retransmitted (see 5.3.2).

If the UA_INTLCK_CTRL field in the Control mode page contains 11b (see SPC-4), termination of a command with TASK SET FULL status shall cause a unit attention condition to be established for the SCSI initiator port on the I_T nexus that sent the command with an additional sense code set to PREVIOUS TASK SET FULL STATUS.

ACA ACTIVE. This status shall be returned as described in 5.9.2 and 5.9.3 when an ACA exists within a task set. The application client may reissue the command on the same I_T nexus after the ACA condition has been cleared.

TASK ABORTED. This status shall be returned when a command is aborted by a command or task management function on another I T nexus and the Control mode page TAS bit is set to one (see 5.6).

5.3.2 Status qualifier

The status qualifier provides additional information about the reason for the status code (see 5.3.1).

The status qualifier format is as shown in table 34.

Table 34 — Status qualifier format

Bit Byte	7	6	5	4	3	2	1	0
0	SCOPE		(MSB)					
1	QUALIFIER						(LSB)	

The SCOPE field (see table 35) indicates the logical unit(s) to which the status qualifier applies.

Table 35 — SCOPE field

Code	Affected logical unit(s)	Affected nexus(es)
00b	The logical unit addressed by the command associated with the status.	All I_T nexus(es).
01b	All logical units accessible by the SCSI target port through which the command associated with the status was routed.	I_T nexus through which the status was returned.
10b	All logical unit(s) contained within the SCSI device that contains the logical unit addressed by the command associated with the status.	All I_T nexus(es).
11b	Reserved	

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 14776-414:2009

The QUALIFIER field (see table 36) indicates additional information about the reason for the status code.

Table 36 — QUALIFIER field

Status code	QUALIFIER field	Description
All	0000h	No additional information (i.e., the same as returning no status qualifier).
BUSY	0001h - 3FEFh	The number of 100 ms increments the application client should wait before sending another command to the logical unit(s) indicated by the SCOPE field using the nexus(es) indicated by the SCOPE field.
	3FF0h - 3FFDh	Reserved
	3FFEh	The application client should stop sending commands to the logical unit(s) indicated by the SCOPE field using the nexus(es) indicated by the SCOPE field.
	3FFFh	The logical unit(s) indicated by the SCOPE field are not able to accept the command because they are servicing too many other I_T nexuses.
TASK SET FULL ^a	0001h - 3FEFh	The application client should wait before sending another command to the logical unit on any I_T nexus until: a) at least the number of 100 ms increments indicated in the QUALIFIER field have elapsed; or b) a command addressed to the logical unit on any I_T nexus completes or terminates.
	3FF0h - 3FFFh	Reserved
GOOD	0001h - 3FFFh	Reserved
CHECK CONDITION	0001h - 3FFFh	Reserved
CONDITION MET	0001h - 3FFFh	Reserved
RESERVATION CONFLICT	0001h - 3FFFh	Reserved
ACA ACTIVE	0001h - 3FFFh	Reserved
TASK ABORTED	0001h - 3FFFh	Reserved
All others	0001h - 3FFFh	Reserved
^a The SCOPE field shall be set to zero.		

5.3.3 Status precedence

If a device server detects that more than one of the following conditions applies to a completed command, it shall select the condition to report based on the following precedence:

- 1) an ACA ACTIVE status;

- 2) a CHECK CONDITION status for any of the following unit attention conditions (i.e., with a sense key set to UNIT ATTENTION and one of the following additional sense codes):
 - A) POWER ON, RESET, OR BUS DEVICE RESET OCCURRED;
 - B) POWER ON OCCURRED;
 - C) SCSI BUS RESET OCCURRED;
 - D) MICROCODE HAS BEEN CHANGED;
 - E) BUS DEVICE RESET FUNCTION OCCURRED;
 - F) DEVICE INTERNAL RESET;
 - G) COMMANDS CLEARED BY POWER LOSS NOTIFICATION; or
 - H) I_T NEXUS LOSS OCCURRED;
 - 3) a RESERVATION CONFLICT status;
- and
- 4) a status of:
 - A) CHECK CONDITION, other than with a sense key set to ILLEGAL REQUEST or for any reason not listed in 2);
 - B) GOOD;
 - C) CONDITION MET; or
 - D) TASK ABORTED.

NOTE 10 The names of the unit attention conditions listed in this subclause (e.g., SCSI BUS RESET OCCURRED) are based on usage in SAM-2. The use of these unit attention condition names is not to be interpreted as a description of how the unit attention conditions are represented by any given SCSI transport protocol.

A device server may report the following status codes with any level of precedence:

- a) BUSY status;
- b) TASK SET FULL status; or
- c) CHECK CONDITION status with a sense key set to ILLEGAL REQUEST.

Any unit attention condition that was established for all logical units (e.g., REPORTED LUNS DATA HAS CHANGED) should be reported with a higher precedence than a CHECK CONDITION status with a sense key set to ILLEGAL REQUEST and an additional sense code set to LOGICAL UNIT NOT SUPPORTED.

5.4 SCSI transport protocol services in support of Execute Command

5.4.1 Overview

The SCSI transport protocol services that support the **Execute Command** procedure call are described in 5.4. The following groups of SCSI transport protocol services are described:

- a) the SCSI transport protocol services that support the delivery of the command and status (see 5.4.2); and
- b) the SCSI transport protocol services that support the data transfers associated with processing a command (see 5.4.3).

5.4.2 Command and status SCSI transport protocol services

5.4.2.1 Command and status SCSI transport protocol services overview

All SCSI transport protocol standards shall define the SCSI transport protocol specific requirements for implementing the **Send SCSI Command** request (see 5.4.2.2), the **SCSI Command Received** indication (see 5.4.2.3), the **Send Command Complete** response (see 5.4.2.4), and the **Command Complete Received** confirmation (see 5.4.2.5) SCSI transport protocol services.

All SCSI initiator devices shall implement the **Send SCSI Command** request and the **Command Complete Received** confirmation SCSI transport protocol services as defined in the applicable SCSI transport protocol

standards. All SCSI target devices shall implement the **SCSI Command Received** indication and the **Send Command Complete** response SCSI transport protocol services as defined in the applicable SCSI transport protocol standards.

5.4.2.2 Send SCSI Command SCSI transport protocol service request

An application client uses the Send SCSI Command SCSI transport protocol service request to request that a SCSI initiator port send a command.

Send SCSI Command SCSI transport protocol service request:

Send SCSI Command (IN (I_T_L_Q Nexus, CDB, Task Attribute, [Data-In Buffer Size], [Data-Out Buffer], [Data-Out Buffer Size], [CRN], [Command Priority], [First Burst Enabled]))

Input arguments:

I_T_L_Q Nexus: The I_T_L_Q nexus identifying the command (see 4.8).

CDB: Command descriptor block (see 5.2).

Task Attribute: A value specifying one of the task attributes defined in 8.6. For specific requirements on the Task Attribute argument see 5.1.

Data-In Buffer Size: The number of bytes available for data transfers to the Data-In Buffer (see 5.4.3). SCSI transport protocols may interpret the Data-In Buffer Size to include both the size and the location of the Data-In Buffer.

Data-Out Buffer: A buffer containing command specific information to be sent to the logical unit (e.g., data or parameter lists needed to process the command (see 5.1)). The content of the Data-Out Buffer shall not change during the lifetime of the command (see 5.5) as viewed by the application client.

Data-Out Buffer Size: The number of bytes available for data transfers from the Data-Out Buffer (see 5.4.3).

CRN: When CRN is used, all commands on an I_T_L nexus include a CRN argument (see 5.1).

Command Priority: The priority assigned to the command (see 8.7).

First Burst Enabled: An argument specifying that a SCSI transport protocol specific number of bytes from the Data-Out Buffer shall be delivered to the logical unit without waiting for the device server to invoke the **Receive Data-Out** SCSI transport protocol service.

5.4.2.3 SCSI Command Received SCSI transport protocol service indication

The task router (see 4.6.8) uses the SCSI Command Received SCSI transport protocol service indication to notify a task manager that it has received a command.

SCSI Command Received SCSI transport protocol service indication:

SCSI Command Received (IN (I_T_L_Q Nexus, CDB, Task Attribute, [CRN], [Command Priority], [First Burst Enabled]))

Input arguments:

- I_T_L_Q Nexus:** The I_T_L_Q nexus identifying the command (see 4.8).
- CDB:** Command descriptor block (see 5.2).
- Task Attribute:** A value specifying one of the task attributes defined in 8.6. For specific requirements on the Task Attribute argument see 5.1.
- CRN:** When a CRN argument is used, all commands on an I_T_L nexus include a CRN argument (see 5.1).
- Command Priority:** The priority assigned to the command (see 8.7).
- First Burst Enabled:** An argument specifying that a SCSI transport protocol specific number of bytes from the Data-Out Buffer are being delivered to the logical unit without waiting for the device server to invoke the **Receive Data-Out** SCSI transport protocol service.

5.4.2.4 Send Command Complete SCSI transport protocol service response

A device server uses the Send Command Complete SCSI transport protocol service response to request that a SCSI target port transmit command complete information.

Send Command Complete SCSI transport protocol service response:

Send Command Complete (IN (I_T_L_Q Nexus, [Sense Data], [Sense Data Length], Status, Service Response, [Status Qualifier]))

Input arguments:

- I_T_L_Q Nexus:** The I_T_L_Q nexus identifying the command (see 4.8).
- Sense Data:** If present, a Sense Data argument instructs the SCSI target port to complete with sense data to the SCSI initiator port (see 5.13).
- Sense Data Length:** The length in bytes of the sense data to be returned to the SCSI initiator port.
- Status:** Command completion status (see 5.1).
- Service Response:** Possible service response information for the command (see 5.1).
- Status Qualifier:** The Status Qualifier code for the command (see 5.3.2).

5.4.2.5 Command Complete Received SCSI transport protocol service confirmation

A SCSI initiator port uses the Command Complete Received SCSI transport protocol service confirmation to notify an application client that it has received command complete information.

Command Complete Received SCSI transport protocol service confirmation:

Command Complete Received (IN (I_T_L_Q Nexus, [Data-In Buffer], [Sense Data], [Sense Data Length], Status, Service Response, [Status Qualifier]))

Input arguments:

I_T_L_Q Nexus: The I_T_L_Q nexus identifying the command (see 4.8).

Data-In Buffer: A buffer containing command specific information returned by the logical unit on command completion (see 5.1).

Sense Data: Sense data returned in the same I_T_L_Q nexus transaction (see 3.1.50) as a CHECK CONDITION status (see 5.13).

Sense Data Length: The length in bytes of the received sense data.

Status: Command completion status (see 5.1).

Service Response: Service response for the command (see 5.1).

Status Qualifier: The status qualifier for the command (see 5.3.2).

5.4.3 Data transfer SCSI transport protocol services

5.4.3.1 Introduction

The data transfer services described in 5.4.3 provide mechanisms for moving data to and from the SCSI initiator port while processing commands. All SCSI transport protocol standards shall define the protocols required to implement these services.

The application client's Data-In Buffer and/or Data-Out Buffer each appears to the device server as a single, logically contiguous block of memory large enough to hold all the data required by the command (see figure 38). This standard allows either unidirectional or bidirectional data transfer. The processing of a command may require the transfer of data from the application client using the Data-Out Buffer, or to the application client using the Data-In Buffer, or both to and from the application client using both the Data-In Buffer and the Data-Out Buffer.

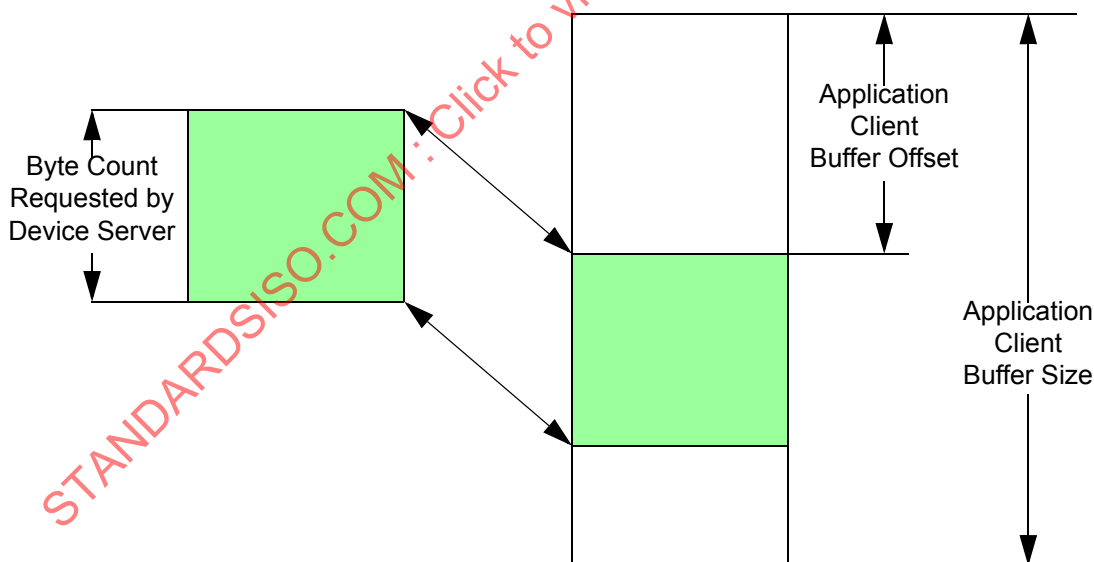

Figure 38 — Model for Data-In and Data-Out data transfers

This standard assumes that the buffering resources available to a logical unit are limited, and the buffer in the logical unit may not be capable of containing all of the data required to be transferred for one command. Such data needs to be moved between the application client and the logical unit in segments that are smaller than the transfer size specified in the command. The amount of data moved per segment is usually a function of the buffering resources available to the logical unit. Figure 38 shows the model for such incremental data transfers.

SCSI transport protocols may allow logical units to accept the initial portion of the Data-Out Buffer data, called the first burst, along with the command without waiting for the device server to invoke the **Receive Data-Out** SCSI transport protocol service. This is modeled using **Receive Data-Out** protocol service calls for which the SCSI transport protocol may have moved the first burst prior to the call.

SCSI transport protocols that define a first burst capability shall include the First Burst Enabled argument in their definitions for the **Send SCSI Command** and **SCSI Command Received** SCSI transport protocol services. Logical units that implement the first burst capability shall implement the FIRST BURST SIZE field in the Disconnect-Reconnect mode page (see SPC-4).

The STPL confirmed services specified in 5.4.3.2 and 5.4.3.3 are used by the device server to request the transfer of data to or from the application client Data-In Buffer or Data-Out Buffer, respectively. The SCSI initiator device SCSI transport protocol service interactions for data transfers are unspecified.

The movement of data between the application client and device server is controlled by the following arguments:

Application Client Buffer Size:	The total number of bytes in the application client's buffer (i.e., equivalent to Data-In Buffer Size for the Data-In Buffer or equivalent to Data-Out Buffer Size for the Data-Out Buffer).
Application Client Buffer Offset:	Offset in bytes from the beginning of the application client's buffer (Data-In or Data-Out) to the first byte of transferred data.
Byte Count Requested by Device Server:	Number of bytes to be moved by the data transfer request.

For any specific data transfer SCSI transport protocol service request, the **Byte Count Requested by Device Server** is less than or equal to the combination of **Application Client Buffer Size** minus the **Application Client Buffer Offset**.

Random buffer access occurs when the device server requests data transfers to or from segments of the application client's buffer that have an arbitrary offset and byte count. Buffer access is sequential when successive transfers access a series of increasing, adjoining buffer segments. Support for random buffer access by a SCSI transport protocol standard is optional. A device server implementation designed for any SCSI transport protocol implementation should be prepared to use sequential buffer access when necessary.

If a SCSI transport protocol supports random buffer access, the offset and byte count specified for each data segment to be transferred may overlap. In this case the total number of bytes moved for a command is not a reliable indicator of highest byte transferred and shall not be used by a SCSI initiator device or SCSI target device implementation to determine whether all data has been transferred.

All SCSI transport protocol standards shall define support for a resolution of one byte for the Application Client Buffer Size argument.

SCSI transport protocol standards may define restrictions on the resolution of the Application Client Buffer Offset argument. SCSI transport protocol standards may define restrictions on the resolution of the Request Byte Count argument for any call to **Send Data-In** or any call to **Receive Data-Out** that does not transfer the last byte of the Application Client Buffer.

This standard provides only for the transfer phases to be sequential. Provision for overlapping transfer phases is outside the scope of this standard.

The STPL confirmed services specified in 5.4.3.4 are used by the task manager or device server to terminate partially completed transfers to the Data-In Buffer or from the Data-Out Buffer. The **Terminate Data Transfer** SCSI transport protocol service requests that one or more **Send Data-In** or **Receive Data-Out** SCSI transport protocol service requests be terminated by a SCSI target port.

5.4.3.2 Data-In delivery service

5.4.3.2.1 Send Data-In SCSI transport protocol service request

A device server uses the Send Data-In SCSI transport protocol service request to request that a SCSI target port send data.

Send Data-In SCSI transport protocol service request:

Send Data-In (IN (I_T_L_Q Nexus, Device Server Buffer, Application Client Buffer Offset, Request Byte Count))

Input arguments:

I_T_L_Q Nexus: The I_T_L_Q nexus identifying the command (see 4.8).

Device Server Buffer: The buffer in the device server from which data is to be transferred.

Application Client Buffer Offset: Offset in bytes from the beginning of the application client's buffer (i.e., the Data-In Buffer) to the first byte of transferred data.

Request Byte Count: Number of bytes to be moved by this request.

5.4.3.2.2 Data-In Delivered SCSI transport protocol service confirmation

A SCSI target port uses the Data-In Delivered SCSI transport protocol service confirmation to notify a device server that it has sent data.

Data-In Delivered SCSI transport protocol service confirmation:

Data-In Delivered (IN (I_T_L_Q Nexus, Delivery Result))

This confirmation notifies the device server that the specified data was successfully delivered to the application client buffer, or that a service delivery subsystem error occurred while attempting to deliver the data.

Input arguments:

I_T_L_Q Nexus: The I_T_L_Q nexus identifying the command (see 4.8).

Delivery Result: an encoded value representing one of the following:
 DELIVERY SUCCESSFUL: The data was delivered successfully.
 DELIVERY FAILURE: A service delivery subsystem error occurred while attempting to deliver the data.

5.4.3.3 Data-Out delivery service

5.4.3.3.1 Receive Data-Out SCSI transport protocol service request

A device server uses the Receive Data-Out SCSI transport protocol service request to request that a SCSI target port receive data.

Receive Data-Out SCSI transport protocol service request:

Receive Data-Out (IN (I_T_L_Q Nexus, Application Client Buffer Offset, Request Byte Count, Device Server Buffer))

Input arguments:

- I_T_L_Q Nexus:** The I_T_L_Q nexus identifying the command (see 4.8).
- Application Client Buffer Offset:** Offset in bytes from the beginning of the application client's buffer (i.e., the Data-Out Buffer) to the first byte of transferred data.
- Device Server Buffer:** The buffer in the device server to which data is to be transferred.
- Request Byte Count:** Number of bytes to be moved by this request.

If the **SCSI Command Received** SCSI transport protocol service included a First Burst Enabled argument and random buffer access is not supported, first burst data shall be transferred to the Device Server Buffer until all first burst data has been transferred. If the **SCSI Command Received** SCSI transport protocol service included a First Burst Enabled argument and random buffer access is supported, first burst data should be transferred to the Device Server Buffer but first burst data may be re-transferred across a service delivery subsystem.

5.4.3.3.2 Data-Out Received SCSI transport protocol service confirmation

A SCSI target port uses the Data-Out Received SCSI transport protocol service confirmation to notify a device server that it has received data.

Data-Out Received SCSI transport protocol service confirmation:

Data-Out Received (IN (I_T_L_Q Nexus, Delivery Result))

This confirmation notifies the device server that the requested data has been successfully delivered to its buffer, or that a service delivery subsystem error occurred while attempting to receive the data.

Input arguments:

- I_T_L_Q Nexus:** The I_T_L_Q nexus identifying the command (see 4.8).
- Delivery Result:** an encoded value representing one of the following:
DELIVERY SUCCESSFUL: The data was delivered successfully.
DELIVERY FAILURE: A service delivery subsystem error occurred while attempting to receive the data.

5.4.3.4 Terminate Data Transfer service

5.4.3.4.1 Terminate Data Transfer SCSI transport protocol service request

A device server or task manager uses the Terminate Data Transfer SCSI transport protocol service request to request that a SCSI target port terminate data transfers.

Terminate Data Transfer SCSI transport protocol service request:

Terminate Data Transfer (IN (Nexus))

Input argument:

- Nexus:** An I_T nexus, I_T_L nexus, or I_T_L_Q nexus (see 4.8).

The SCSI target port terminates all transfer service requests for the specified nexus (e.g., if an I_T_L nexus is specified, then the SCSI target port terminates all transfer service requests from the logical unit for the specified SCSI initiator port).

5.4.3.4.2 Data Transfer Terminated SCSI transport protocol service confirmation

A SCSI target port uses the Data Transfer Terminated SCSI transport protocol service confirmation to notify a device server or task manager that it has terminated all outstanding data transfers for a specified nexus.

Data Transfer Terminated SCSI transport protocol service confirmation:

Data Transfer Terminated (IN (Nexus))

Input argument:

Nexus: An I_T nexus, I_T_L nexus, or I_T_L_Q nexus (see 4.8).

This confirmation is returned in response to a **Terminate Data Transfer** request whether or not the specified nexus existed in the SCSI target port when the request was received. After a **Data Transfer Terminated** SCSI transport protocol service confirmation has been sent in response to a **Terminate Data Transfer** SCSI transport protocol service request, **Data-In Delivered** or **Data-Out Received** SCSI transport protocol service confirmations shall not be sent for the commands specified by the nexus.

5.5 Command lifetimes

This subclause specifies the events delimiting the beginning and end (i.e., lifetime) of a command from the viewpoint of the application client and device server. The task router and task manager have the same viewpoint of the beginning and end of a command as the device server.

An application client maintains an application client command from the time the **Send SCSI Command** SCSI transport protocol service request is invoked until the application client receives one of the following SCSI target device responses:

- a) a service response of COMMAND COMPLETE for that command;
- b) notification of a unit attention condition with one of the following additional sense codes;
 - A) any additional sense code whose ADDITIONAL SENSE CODE field contains 2Fh (e.g., COMMANDS CLEARED BY ANOTHER INITIATOR, COMMANDS CLEARED BY POWER LOSS NOTIFICATION or COMMANDS CLEARED BY DEVICE SERVER), if in reference to the task set containing the command;
 - B) any additional sense code whose ADDITIONAL SENSE CODE field contains 29h (e.g., POWER ON, RESET, OR BUS DEVICE RESET OCCURRED; POWER ON OCCURRED; SCSI BUS RESET OCCURRED; BUS DEVICE RESET FUNCTION OCCURRED; DEVICE INTERNAL RESET; or I_T NEXUS LOSS OCCURRED); or
 - C) MICROCODE HAS BEEN CHANGED.
- c) notification that the task manager has detected the use of a duplicate I_T_L_Q nexus (see 5.10);
- d) a service response of FUNCTION COMPLETE following an ABORT TASK task management function directed to the specified command;
- e) a service response of FUNCTION COMPLETE following an ABORT TASK SET or a CLEAR TASK SET task management function directed to the task set containing that command;
- f) a service response of FUNCTION COMPLETE following an I_T NEXUS RESET task management function delivered on the I_T nexus used to deliver that command;
- g) a service response of FUNCTION COMPLETE in response to a LOGICAL UNIT RESET task management function directed to the logical unit;
- h) a service response of FUNCTION COMPLETE following a QUERY TASK task management function directed to the specified command; or
- i) a service response of FUNCTION COMPLETE following a QUERY TASK SET task management function directed to the specified task set.

NOTE 11 Items other than a) assume in-order delivery (see 4.4.3).

If a service response of SERVICE DELIVERY OR TARGET FAILURE is received for a command (e.g., when an I_T nexus loss is detected by the SCSI initiator port), the application client shall maintain an application client command to represent the command until the application client has determined that the command is no longer known to the device server.

NOTE 12 The names of the unit attention conditions listed in the subclause (e.g., SCSI BUS RESET OCCURRED) are based on usage in SAM-2. The use of these unit attention condition names is not to be interpreted as a description of how the unit attention conditions are represented by any given SCSI transport protocol.

The device server shall create a command upon receiving a **SCSI Command Received** indication.

The command shall exist until:

- a) the device server sends a SCSI transport protocol service response for the command of COMMAND COMPLETE; or
- b) the command is aborted as described in 5.6.

When a SCSI transport protocol does not require state synchronization (see 4.4.2), there may be a time skew between the completion of a device server request-response transaction as seen by the application client and device server. As a result, the lifetime of a command as it appears to the application client is different from the lifetime observed by the device server.

Some commands initiate background operations that are processed after the command is no longer in the task set (i.e., status has been returned for the command) (e.g., a SEND DIAGNOSTIC command when used to initiate a background self-test (see SPC-4) or a write command when write cache is enabled (see SBC-3)). Background operations may be aborted by power on, hard reset, or logical unit reset. Background operations shall not be aborted by I_T nexus loss or power loss expected.

Background operations may generate deferred errors that are reported in the sense data for a subsequent command (see SPC-4). Information that a deferred error occurred may be cleared before it is reported (e.g., by power on, hard reset, or logical unit reset). Deferred errors should not be cleared by I_T nexus loss or power loss expected.

Unless a command completes with a GOOD status or CONDITION MET status, the degree to which the required command processing has been completed is vendor specific.

5.6 Aborting commands

A command is aborted when a SCSI device condition (see 6.3), command, or task management function causes termination of the command prior to its completion by the device server.

See table 37 for a list of the SCSI device conditions that cause commands to be aborted in a SCSI initiator device.

Table 37 — SCSI device conditions that abort commands in a SCSI initiator device

SCSI device condition	Scope	Reference
Power on	All commands in the SCSI initiator device.	6.3.1
Hard reset	All commands with an I_T nexus involving the SCSI initiator port.	6.3.2
I_T nexus loss	All commands associated with the lost I_T nexus.	6.3.4
SCSI transport protocol specific conditions	As defined by the applicable SCSI transport protocol standard.	

See table 38 for a list of the SCSI device conditions that cause commands to be aborted in a SCSI target device.

Table 38 — SCSI device conditions that abort commands in a SCSI target device

SCSI device condition	Scope	Unit attention condition (see 5.14) additional sense code, if any	TASK ABORTED status ^a	Reference
Power on	All commands in the SCSI target device.	See table 47	No	6.3.1
Hard reset	All commands in all logical units to which the SCSI target port has access in the SCSI target device.		Yes or no ^c	6.3.2
Logical unit reset ^b	All commands in the logical unit.		Yes or no ^d	6.3.3 and 7.7
I_T nexus loss ^b	In each logical unit to which the SCSI target port has access, all commands associated with the lost I_T nexus.		No	6.3.4 and 7.6
Power loss expected	All commands in the SCSI target device.	COMMANDS CLEARED BY POWER LOSS NOTIFICATION	No	6.3.5
SCSI transport protocol specific conditions	As defined by the applicable SCSI transport protocol standard.			
^a “Yes” indicates that each command that is aborted on an I_T nexus other than the one that caused the SCSI device condition is completed with TASK ABORTED status, if the TAS bit is set to one in the Control mode page (see SPC-4). “No” indicates that no status is returned for aborted commands. ^b This SCSI device condition is able to be invoked by a task management function listed in table 39. ^c If the hard reset is caused by a particular I_T nexus (e.g., by a SCSI transport protocol-specific task management function), then “yes” applies. Otherwise, “no” applies. ^d If the logical unit reset is caused by a particular I_T nexus (e.g., by a LOGICAL UNIT RESET task management function), then “yes” applies. Otherwise (e.g., if triggered by a hard reset), “no” applies.				

See table 39 for a list of the task management functions that cause commands to be aborted.

Table 39 — Task management functions that abort commands

Task management function	Scope	Unit attention condition (see 5.14) additional sense code, if any ^a	TASK ABORTED status ^b	Reference
ABORT TASK (I_T_L_Q nexus)	Command specified by the I_T_L_Q Nexus argument.	None	No	6.3.1 and 7.2
ABORT TASK SET (I_T_L nexus)	All commands in the task set with the same I_T nexus as that specified by the I_T_L Nexus argument.	None	No	6.3.2 and 7.3
CLEAR TASK SET (I_T_L nexus)	All commands in the task set ^c	COMMANDS CLEARED BY ANOTHER INITIATOR	Yes	7.5
LOGICAL UNIT RESET (I_T_L nexus)	See table 38 for a description of the logical unit reset condition.			
I_T NEXUS RESET (I_T nexus)	See table 38 for a description of the I_T nexus loss condition.			

^a If the TAS bit is set to zero in the Control mode page (see SPC-4), the device server creates this unit attention condition for each I_T nexus that had command(s) aborted other than the I_T nexus that delivered the task management function. If the TAS bit is set to one in the Control mode page (see SPC-4), the device server does not create this unit attention condition.

^b “Yes” indicates that each command that is aborted on an I_T nexus other than the one that delivered the task management function is completed with TASK ABORTED status, if the TAS bit is set to one in the Control mode page. “No” indicates that no status is returned for aborted commands.

^c If the TST field is set to 001b (i.e., per I_T nexus) in the Control mode page (see SPC-4), there is one task set per I_T nexus, as a result, no other I_T nexuses are affected and CLEAR TASK SET is equivalent to ABORT TASK SET.

See table 40 for a list of the command related conditions that cause commands to be aborted.

Table 40 — Command related conditions that abort commands

Command related conditions	Scope	Unit attention condition (see 5.14) additional sense code, if any ^a	TASK ABORTED status ^b	Reference
CHECK CONDITION status if: a) the QERR field is set to 01b; and b) the TST field is set to 000b (i.e., shared) in the Control mode page (see SPC-4).	All commands in the task set.	COMMANDS CLEARED BY ANOTHER INITIATOR	Yes	5.8.3 and 5.9.2
CHECK CONDITION status if: a) the QERR field is set to 01b; and b) the TST field is set to 001b (i.e., per I_T nexus) in the Control mode page (see SPC-4).	All commands in the task set. ^c	None	No	5.8.3 and 5.9.2
Completion of a command with a CHECK CONDITION status if the QERR field is set to 11b in the Control mode page (see SPC-4).	All commands in the task set with the same I_T nexus as the command that was terminated.	None	No	5.8.3 and 5.9.2
Processing of a PERSISTENT RESERVE OUT command with a PREEMPT AND ABORT service action with a reservation key that is associated with the I_T nexus on which the command was received (see SPC-4).	All commands from all I_T nexuses with the specified reservation key.	COMMANDS CLEARED BY ANOTHER INITIATOR	Yes	SPC-4
The return of an Execute Command service response of SERVICE DELIVERY OR TARGET FAILURE.	The indicated command.	None	No	5.1
Termination of an overlapped command.	All commands with the same I_T nexus as the command that was terminated.	None	No	5.10
^a If the TAS bit is set to zero in the Control mode page (see SPC-4), the device server creates this unit attention condition for each I_T nexus that had command(s) aborted other than the I_T nexus that delivered the task management function. If the TAS bit is set to one in the Control mode page (see SPC-4), the device server does not create this unit attention condition. ^b "Yes" indicates that each command that is aborted on an I_T nexus other than the one that delivered the command is completed with TASK ABORTED status, if the TAS bit is set to one in the Control mode page (see SPC-4). "No" indicates that no status is returned for aborted commands. ^c As a result of the TST field being set to 001b, there is one task set per I_T nexus, so no other I_T nexuses are affected.				

If one or more commands are cleared or aborted, the affected commands are also cleared from the SCSI initiator ports in a manner that is outside the scope of this standard.

When a device server receives a command or task management function on an I_T nexus that causes commands on the same I_T nexus to be aborted, the device server shall not return any notification that commands have been aborted other than:

- a) a completion response for the command or task management function that caused the command(s) to be aborted; and
- b) notification(s) associated with related effects of the command or task management function (e.g., a reset unit attention condition).

When a device server receives a command or task management function on an I_T nexus that causes commands on other I_T nexuses to be aborted, the device server shall return any notifications for those commands based on the setting of the TAS bit in the Control mode page (see SPC-4):

- a) if the TAS bit is set to zero, the device server:
 - A) shall not return status for the commands that were aborted; and
 - B) shall establish a unit attention condition for the SCSI initiator port associated with each I_T nexus containing commands that were aborted with an additional sense code set as defined in table 39 and table 40;
- or
- b) if the TAS bit is set to one, the device server:
 - A) shall complete each aborted command with a TASK ABORTED status; and
 - B) shall not establish a unit attention condition for this reason.

When a logical unit completes one or more commands received on an I_T nexus with a status of TASK ABORTED, the logical unit should complete all of the affected commands before entering any other commands received on that I_T nexus into the task set.

5.7 Command processing example

A command is used to show the events associated with the processing of a single device service request (see figure 39). This example does not include error or exception conditions.

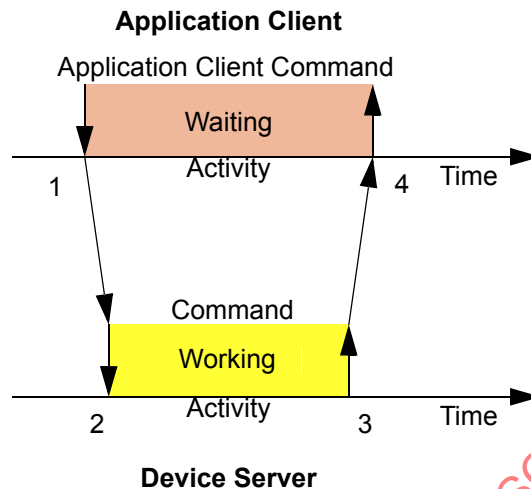

Figure 39 — Command processing events

The numbers in figure 39 identify the events described as follows:

- 1) the application client command performs an **Execute Command** procedure call by invoking the **Send SCSI Command** SCSI transport protocol service to send the CDB and other input parameters to the logical unit.
- 2) the device server is notified through a **SCSI Command Received** indication containing the CDB and command parameters. A command is created and entered into the task set. The device server may invoke the appropriate data delivery service one or more times to complete command processing.
- 3) on command completion, the **Send Command Complete** SCSI transport protocol service is invoked to return a GOOD status and a service response of COMMAND COMPLETE.
- 4) a confirmation of **Command Complete Received** is passed to the application client by the SCSI initiator port.

5.8 Commands that complete with CHECK CONDITION status

5.8.1 Overview

An application client uses the NACA bit in the CONTROL byte of the CDB (see 5.2) to specify whether or not the device server establishes an ACA condition when it terminates a command with CHECK CONDITION status. The meaning of the value in the NACA bit is as follows:

- a) If the NACA bit is set to zero, an ACA condition shall not be established; or
- b) If the NACA bit is set to one, an ACA condition shall be established (see 5.9).

The requirements that apply when the ACA condition is not in effect are described in 5.8.2.

When a command terminates with a CHECK CONDITION status and an ACA condition is not established, commands other than the command completing with a the CHECK CONDITION status may be aborted as described in 5.8.3.

5.8.2 Handling commands when ACA is not in effect

Table 41 describes the handling of commands when an ACA condition is not in effect for the task set. The I_T nexuses that are associated with a task set are specified by the TST field in the Control mode page (see SPC-4).

Table 41 — Command handling when ACA is not in effect

New command properties		Device server action	ACA established if new command terminates with a CHECK CONDITION status
Task attribute ^a	NACA value ^b		
Any task attribute except the ACA task attribute	0	Process the command. ^c	No
	1		Yes
ACA task attribute	0	Process an invalid task attribute condition as described in 5.12.	No
	1		Yes

^a Task attributes are described in 8.6.
^b The NACA bit is in the CONTROL byte in the CDB (see 5.2).
^c All the conditions that affect the processing of commands (e.g., reservations) apply.

5.8.3 Aborting commands terminated with a CHECK CONDITION status without establishing an ACA

When a command terminates with a CHECK CONDITION status where the NACA bit is set to zero in the command's CDB CONTROL byte (i.e., when an ACA condition is not established), commands in the dormant command state or enabled command state (see 8.5) may be aborted based on the contents of the TST field and QEERR field in the Control mode page (see SPC-4) as shown in table 42. The TST field specifies the type of task set in the logical unit. The QEERR field specifies how the device server handles commands in the blocked command state and dormant command state when another command terminates with a CHECK CONDITION status.

Table 42 — Aborting commands when an ACA is not established

QEERR	TST	Action
00b	000b	Commands other than the command terminated with a CHECK CONDITION status shall not be aborted.
	001b	
01b	000b	All enabled and dormant commands received on all I_T nexuses shall be aborted (see 5.6).
	001b	All enabled and dormant commands received on the I_T nexus on which the CHECK CONDITION status was returned shall be aborted (see 5.6). All commands received on other I_T nexuses shall not be aborted.
11b	000b	All enabled and dormant commands received on the I_T nexus on which the CHECK CONDITION status was returned shall be aborted (see 5.6). All commands received on other I_T nexuses shall not be aborted.
	001b	

5.9 Auto contingent allegiance (ACA)

5.9.1 ACA overview

The application client may request that the device server alter command processing when a command terminates with a CHECK CONDITION status by establishing an ACA condition using the NACA bit in the CONTROL byte (see 5.8.1).

The steps taken by the device server to establish an ACA condition are described in 5.9.2. Upon establishment of the ACA condition, some commands other than the command completing with the CHECK CONDITION status may be aborted and continued processing of other commands may be blocked as described in 5.9.2.

While the ACA condition is in effect and the TMF_ONLY bit is set to zero in the Control mode page (see SPC-4), new commands received by the logical unit from the faulted I_T nexus are not allowed to enter the task set unless they have the ACA task attribute (see 8.6.5). One of the results of the ACA task attribute requirement is that commands in-flight, when the CHECK CONDITION status occurs, are completed unprocessed with an ACA ACTIVE status. Multiple commands may be sent one at a time using the ACA task attribute to recover from the event that resulted in the ACA condition without clearing the ACA condition.

While the ACA condition is in effect and the TMF_ONLY bit is set to one, no new commands received by the logical unit from the faulted I_T nexus are allowed to enter the task set.

While the ACA condition is in effect:

- a) new commands received on the faulted I_T nexus shall be handled as described in 5.9.3, and
- b) new commands received on I_T nexuses other than the faulted I_T nexus shall be handled as described in 5.9.4.

The methods for clearing an ACA condition are described in 5.9.5.

5.9.2 Establishing an ACA

When a device server terminates a command with a CHECK CONDITION status and the NACA bit was set to one in the CONTROL byte of the faulting command, the device server shall create an ACA condition.

When an ACA condition is established, commands in the dormant command state or enabled command state (see 8.5) shall either be aborted or blocked based on the contents of the TST field and QERR field in the Control mode page (see SPC-4) as shown in table 43. The TST field specifies the type of task set in the logical unit. The QERR field specifies how the device server handles commands in the blocked command state and the dormant command state when another command terminates with a CHECK CONDITION status.

Table 43 — Blocking and aborting commands when an ACA is established

QERR	TST	Action
00b	000b	All enabled commands received on all I_T nexuses shall transition to the blocked command state (see 8.8). All dormant commands received on all I_T nexuses shall remain in the dormant command state.
	001b	All enabled commands received on the faulted I_T nexus shall transition to the blocked command state (see 8.8). All dormant commands received on the faulted I_T nexus shall remain in the dormant command state. All commands received on I_T nexuses other than the faulted I_T nexus shall not be affected by the establishment of this ACA condition.
01b	000b	All enabled and dormant commands received on all I_T nexuses shall be aborted (see 5.6).
	001b	All enabled and dormant commands received on the faulted I_T nexus shall be aborted (see 5.6). All commands received on I_T nexuses other than the faulted I_T nexus shall not be affected by the establishment of this ACA condition.
11b	000b	All enabled and dormant commands received on the faulted I_T nexus shall be aborted (see 5.6). All enabled commands received on I_T nexuses other than the faulted I_T nexus shall transition to the blocked command state (see 8.8). All dormant commands received on I_T nexuses other than the faulted I_T nexus shall remain in the dormant command state.
	001b	All enabled and dormant commands received on the faulted I_T nexus shall be aborted (see 5.6). All commands received on I_T nexuses other than the faulted I_T nexus shall not be affected by the establishment of this ACA condition.

An ACA condition shall not cross task set boundaries and shall be preserved until it is cleared as described in 5.9.5.

If the SCSI transport protocol does not enforce state synchronization as described in 4.6.14, there may be a time delay between the occurrence of the ACA condition and the time at which the application client becomes aware of the condition.

5.9.3 Handling new commands received on the faulted I_T nexus when ACA is in effect

Table 44 describes the handling of new commands received on the faulted I_T nexus when ACA is in effect.

Table 44 — Handling for new commands received on a faulted I_T nexus during ACA

New command properties		ACA command present in the Task Set	TMF_ONLY value ^c	Device server action	ACA established if new command terminates with a CHECK CONDITION status
Task attribute ^a	NACA value ^b				
ACA task attribute	0	No	0	Process the command. ^e	No ^d
	1	No	0		Yes ^d
	n/a	n/a	1	Complete the command with ACA ACTIVE status.	n/a
	0 or 1	Yes	n/a		n/a
Any task attribute except the ACA task attribute	0 or 1	n/a	n/a	Complete the command with ACA ACTIVE status.	n/a

^a Task attributes are described in 8.6.
^b The NACA bit is in the CONTROL byte in the CDB (see 5.2).
^c The TMF_ONLY bit is in the Control mode page (see SPC-4).
^d If a command with the ACA task attribute terminates with a CHECK CONDITION status, the existing ACA condition shall be cleared and the value of the NACA bit shall control the establishment of a new ACA condition.
^e All the conditions that affect the processing of commands (e.g., reservations) apply.

5.9.4 Handling new commands received on non-faulted I_T nexuses when ACA is in effect

5.9.4.1 Command processing permitted for commands received on non-faulted I_T nexuses during ACA

The device server shall process a PERSISTENT RESERVE OUT command with a PREEMPT AND ABORT service action (see SPC-4) while an ACA condition is established when the command is received on a non-faulted I_T nexus.

NOTE 13 The processing of specific commands (e.g., PERSISTENT RESERVE OUT command with a PREEMPT AND ABORT service action) received on a non-faulted I_T nexus, while an ACA condition is in effect, provides SCSI initiator ports not associated with the faulted I_T nexus the opportunity to recover from error conditions that the SCSI initiator port associated with the faulted I_T nexus is unable to recover by itself.

5.9.4.2 Handling new commands received on non-faulted I_T nexuses when ACA is in effect

The handling of commands received on I_T nexuses other than the faulted I_T nexus depends on the value in the TST field in the Control mode page (see SPC-4).

Table 45 describes the handling of new commands received on I_T nexuses other than the faulted I_T nexus when ACA is in effect.

Table 45 — Handling for new commands received on non-faulted I_T nexuses during ACA

TST field value in Control mode page	New command properties		New command permitted during ACA ^c	Device server action	ACA established if new command terminates with a CHECK CONDITION status
	Task attribute ^a	NACA value ^b			
000b	ACA task attribute	n/a	n/a	Complete the command with ACA ACTIVE status.	n/a
	Any task attribute except the ACA task attribute	0	No	Complete the command with BUSY status.	n/a
		1	No	Complete the command with ACA ACTIVE status.	n/a
		0	Yes	Process the command.	No ^d
		1	Yes		Yes ^d
001b	ACA task attribute	0	n/a	Process an invalid task attribute condition as described in 5.12.	No
		1			Yes
	Any task attribute except the ACA task attribute	0 or 1	n/a	Process the command. ^e	See 5.8.2.
^a Task attributes are described in 8.6. ^b The NACA bit is in the CONTROL byte in the CDB (see 5.2). ^c See 5.9.4.1. ^d If a permitted command terminates with a CHECK CONDITION status, the existing ACA condition shall be cleared and the value of the NACA bit shall control the establishment of a new ACA condition. ^e When the TST field in the Control mode page contains 001b, commands received on a non-faulted I_T nexus shall be processed as if the ACA condition does not exist (see 5.8.2). In this case, the logical unit shall be capable of handling concurrent ACA conditions and sense data associated with each I_T nexus.					

5.9.5 Clearing an ACA condition

An ACA condition shall only be cleared:

- as a result of a hard reset (see 6.3.2), logical unit reset (see 6.3.3), or I_T nexus loss (see 6.3.4);
- by a CLEAR ACA task management function (see 7.4) received on the faulted I_T nexus;
- by a PERSISTENT RESERVE OUT command with a PREEMPT AND ABORT service action with the ACA task attribute received on the faulted I_T nexus that clears the commands received on the faulted I_T nexus (see SPC-4);
- by a PERSISTENT RESERVE OUT command with a PREEMPT AND ABORT service action with a task attribute other than the ACA task attribute received on a non-faulted I_T nexus that clears the commands received on the faulted I_T nexus;
- when a command with the ACA task attribute received on the faulted I_T nexus terminates with a CHECK CONDITION status; or
- when a PERSISTENT RESERVE OUT command with a PREEMPT AND ABORT service action terminates with a CHECK CONDITION status.

Cases e) and f) may result in the establishment of a new ACA based on the value of the NACA bit.

When an ACA condition is cleared and no new ACA condition is established, the state of all commands in the task set shall be modified as described in 8.8.

5.10 Overlapped commands

An overlapped command occurs when a task manager or a task router detects the use of a duplicate I_T_L_Q nexus (see 4.6.6) in a command before that I_T_L_Q nexus completes its command lifetime (see 5.5). Each SCSI transport protocol standard shall specify whether or not a task manager or a task router is required to detect overlapped commands.

A task manager or a task router that detects an overlapped command shall abort all commands received on the I_T nexus on which the overlapped command was received and the device server shall return a CHECK CONDITION status for the overlapped command. The sense key shall be set to ABORTED COMMAND and the additional sense code shall be set to OVERLAPPED COMMANDS ATTEMPTED.

NOTE 14 An overlapped command may be indicative of a serious error and, if not detected, may result in corrupted data. This is considered a catastrophic failure on the part of the SCSI initiator device. Therefore, vendor specific error recovery procedures may be required to guarantee the data integrity on the medium. The SCSI target device logical unit may return additional sense data to aid in this error recovery procedure (e.g., sequential-access devices may terminate the overlapped command with the residue of blocks remaining to be written or read at the time the second command was received).

5.11 Incorrect logical unit

The SCSI target device's response to a command addressed to an incorrect logical unit number is described in this subclause.

In response to a REQUEST SENSE command, a REPORT LUNS command, or an INQUIRY command the SCSI target device shall respond as defined in SPC-4.

Any command except REQUEST SENSE, REPORT LUNS, or INQUIRY:

- a) shall be terminated with CHECK CONDITION status, with the sense key set to ILLEGAL REQUEST, and with the additional sense code set to LOGICAL UNIT NOT SUPPORTED, if:
 - A) the SCSI target device is not capable of supporting the logical unit (e.g., some SCSI target devices support only one peripheral device); or
 - B) the SCSI target device supports the logical unit, but the peripheral device is not currently connected to the SCSI target device;
- or
- b) is responded to in a vendor specific manner, if:
 - A) the SCSI target device supports the logical unit and the peripheral device is connected, but the peripheral device is not operational; or
 - B) the SCSI target device supports the logical unit but is incapable of determining if the peripheral device is connected or is not operational because the peripheral device is not ready.

5.12 Task attribute exception conditions

If a command is received with a task attribute that is not supported or is not valid (e.g., an ACA task attribute when an ACA condition does not exist), the command shall be terminated with CHECK CONDITION status with the sense key set to ILLEGAL REQUEST and the additional sense code set to INVALID MESSAGE ERROR.

NOTE 15 The use of the INVALID MESSAGE ERROR additional sense code is based on its similar usage in SAM-2. The use of the INVALID MESSAGE ERROR additional sense code is not to be interpreted as a description of how the task attributes are represented by any given SCSI transport protocol.

Task attribute support should be reported with the Extended INQUIRY Data VPD page (see SPC-4).

5.13 Sense data

Sense data shall be made available by the logical unit in the event that a command terminates with a CHECK CONDITION status or other conditions (e.g., the processing of a REQUEST SENSE command). The format, content, and conditions under which sense data shall be prepared by the logical unit are specified in this standard, SPC-4, the applicable command standard, and the applicable SCSI transport protocol standard.

Sense data associated with an I_T nexus shall be preserved by the logical unit until:

- a) the sense data is transferred;
- b) a logical unit reset (see 6.3.3) occurs;
- c) an I_T nexus loss (see 6.3.4) occurs for the I_T nexus associated with the preserved sense data; or
- d) power loss expected (see 6.3.5) occurs.

When a command terminates with a CHECK CONDITION status, sense data shall be returned in the same I_T_L_Q nexus transaction (see 3.1.50) as the CHECK CONDITION status. After the sense data is returned, it shall be cleared except when it is associated with a unit attention condition and the UA_INTLCK_CTRL field in the Control mode page (see SPC-4) contains 10b or 11b.

Completion with sense data in the same I_T_L_Q nexus transaction as a CHECK CONDITION status shall not affect ACA (see 5.9) or the sense data associated with a unit attention condition when the UA_INTLCK_CTRL field contains 10b or 11b.

5.14 Unit attention condition

Each logical unit shall establish a unit attention condition whenever one of the following events occurs:

- a) a power on (see 6.3.1), hard reset (see 6.3.2), logical unit reset (see 6.3.3), I_T nexus loss (see 6.3.4), or power loss expected (see 6.3.5) occurs;
- b) Commands received on this I_T nexus have been cleared by a command or a task management function associated with another I_T nexus and the TAS bit was set to zero in the Control mode page associated with this I_T nexus (see 5.6);
- c) the logical unit inventory has been changed (see 4.6.19.1); or
- d) any other event requiring the attention of the SCSI initiator device.

Unit attention conditions are classified by precedence levels. Table 46 defines the unit attention condition precedence levels.

Table 46 — Unit attention condition precedence level

Unit attention condition additional sense code	Unit attention condition precedence
POWER ON, RESET, OR BUS DEVICE RESET OCCURRED	highest
POWER ON OCCURRED or DEVICE INTERNAL RESET	
SCSI BUS RESET OCCURRED or MICROCODE HAS BEEN CHANGED or protocol specific	
BUS DEVICE RESET FUNCTION OCCURRED	
I_T NEXUS LOSS OCCURRED	
COMMANDS CLEARED BY POWER LOSS NOTIFICATION	
all others	Lowest

For unit attention conditions with the lowest precedence level with a given ADDITIONAL SENSE CODE field value, the unit attention condition with the ADDITIONAL SENSE CODE QUALIFIER field set to 00h has higher precedence level than the unit attention conditions with the ADDITIONAL SENSE CODE QUALIFIER field set to values other than 00h (e.g., PARAMETERS CHANGED has precedence over MODE PARAMETERS CHANGED and LOG PARAMETERS CHANGED). A unit attention condition with the lowest precedence level has equal priority with all unit attention conditions with the lowest precedence level with different ADDITIONAL SENSE CODE field values.

NOTE 16 The unit attention additional sense code specificity order defined in 6.2 determines which unit attention condition is allowed to be established when certain conditions occur. The unit attention condition precedence defined in this subclause determines which unit attention conditions are allowed to clear other unit attention conditions if they have not yet been reported.

The device server shall maintain a queue of unit attention conditions of unspecified order for each I_T nexus. The queue should be large enough to hold every unit attention condition that the device server is capable of reporting.

When a device server establishes a unit attention condition:

- 1) the device server may clear unit attention conditions from the queue that are no longer needed as follows:
 - A) the device server may clear any pending unit attention conditions in the queue that have lower precedence levels (e.g., BUS DEVICE RESET FUNCTION OCCURRED may clear I_T NEXUS LOSS OCCURRED and all unit attention conditions with a lower precedence); and
 - B) the device server should clear pending unit attention conditions that have the same additional sense code (i.e., the device server should not add the same unit attention condition twice);
- 2) if a queue slot is available, then:
 - A) if a higher precedence unit attention condition is not in the queue, the device server shall add the unit attention condition to the queue; or
 - B) if a higher precedence unit attention condition is in the queue, the device server should add the unit attention condition to the queue.

In the sense data for the unit attention condition, the device shall either:

- A) not include sense-key specific sense data; or
- B) include sense-key specific sense data and set the OVERFLOW bit to zero (see SPC-4);

or

- 3) if a queue slot is not available, then the device server shall either:
 - A) replace any unit attention condition in the queue; or

B) not add the unit attention condition to the queue.

The device server shall include sense-key specific sense data and set the OVERFLOW bit to one (see SPC-4) for at least one unit attention condition in the queue.

If the device server establishes multiple unit attention conditions as a result of the same event or a series of events, then it may establish the unit attention conditions in any order (e.g., in direct-access block devices, if a MODE SELECT command changes the initial command priority value, the device server may report PRIORITY CHANGED before MODE PARAMETERS CHANGED or may report MODE PARAMETERS CHANGED before PRIORITY CHANGED).

When the device server reports and clears a unit attention condition, it:

- a) may select any unit attention condition in the queue to report; and
- b) shall clear the unit attention condition from the queue after reporting it.

A unit attention condition shall persist until the device server clears the unit attention condition. Unit attention conditions are affected by the processing of commands as follows:

- a) if an INQUIRY command enters the enabled command state, the device server shall process the INQUIRY command and shall neither report nor clear any unit attention condition;
- b) if a REPORT LUNS command enters the enabled command state, the device server shall process the REPORT LUNS command and shall not report any unit attention condition;
- c) if the UA_INTLCK_CTRL field in the Control mode page is set to 00b (see SPC-4), the SCSI target device shall clear any pending unit attention condition with an additional sense code of REPORTED LUNS DATA HAS CHANGED established for the SCSI initiator port associated with that I_T nexus in each logical unit accessible by the I_T nexus on which the REPORT LUNS command was received. Other pending unit attention conditions shall not be cleared;
- d) if the UA_INTLCK_CTRL field in the Control mode page contains 10b or 11b, the SCSI target device shall not clear any unit attention condition(s);
- e) if a REQUEST SENSE command enters the enabled command state while a unit attention condition exists for the SCSI initiator port associated with the I_T nexus on which the REQUEST SENSE command was received, then the device server shall process the command and either:
 - A) report any pending sense data as parameter data and preserve all unit attention conditions on the logical unit; or
 - B) report a unit attention condition as parameter data for the REQUEST SENSE command to the SCSI initiator port associated with the I_T nexus on which the REQUEST SENSE command was received. The logical unit may discard any pending sense data and shall clear the reported unit attention condition for the SCSI initiator port associated with that I_T nexus. If the unit attention condition has an additional sense code of REPORTED LUNS DATA HAS CHANGED, the SCSI target device shall clear any pending unit attention conditions with an additional sense code of REPORTED LUNS DATA HAS CHANGED established for the I_T nexus on which the command was received in each logical unit accessible by that I_T nexus;
- f) if the device server has already generated the ACA condition (see 5.9) for a unit attention condition, the device server shall report the unit attention condition (i.e., option e)B) above);
- g) if the device server supports the NOTIFY DATA TRANSFER DEVICE command (see ADC-2) and a NOTIFY DATA TRANSFER DEVICE command enters the enabled command state, then the device server shall process the NOTIFY DATA TRANSFER DEVICE command and shall neither report nor clear any unit attention condition;
- h) if a command other than INQUIRY, REPORT LUNS, REQUEST SENSE, or NOTIFY DATA TRANSFER DEVICE enters the enabled command state while a unit attention condition exists for the SCSI initiator port associated with the I_T nexus on which the command was received, the device server shall terminate the command with a CHECK CONDITION status. The device server shall provide sense data that reports a unit attention condition for the SCSI initiator port that sent the command on the I_T nexus; and
- i) if a device server reports a unit attention condition with a CHECK CONDITION status and the UA_INTLCK_CTRL field in the Control mode page contains 00b (see SPC-4), then the device server shall clear the reported unit attention condition for the SCSI initiator port associated with that I_T nexus on the logical unit. If the unit attention condition has an additional sense code of REPORTED LUNS DATA HAS CHANGED, the SCSI target device shall clear any pending unit attention conditions with an additional sense code of REPORTED LUNS DATA HAS CHANGED established for the I_T

nexus on which the command was received in each logical unit accessible by that I_T nexus. If the UA_INTLCK_CTRL field contains 10b or 11b, the device server shall not clear unit attention conditions reported with a CHECK CONDITION status.

6 SCSI events and event notification model

6.1 SCSI events overview

SCSI events may occur or be detected in either:

- a) the SCSI device;
- b) one or more SCSI ports within a SCSI device; or
- c) the application client, task manager, or device server.

The detection of any event may require processing by the object that detects it.

Events that occur in a SCSI device are assumed to be detected and processed by all objects within the SCSI device.

When a SCSI port detects an event, it shall use the event notification services (see 6.4) to notify device servers, task managers, or application clients that the event has been detected.

The events detected and event notification services usage depends on whether the SCSI device is a SCSI target device (see figure 40) or a SCSI initiator device (see figure 41).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 14776-414:2009

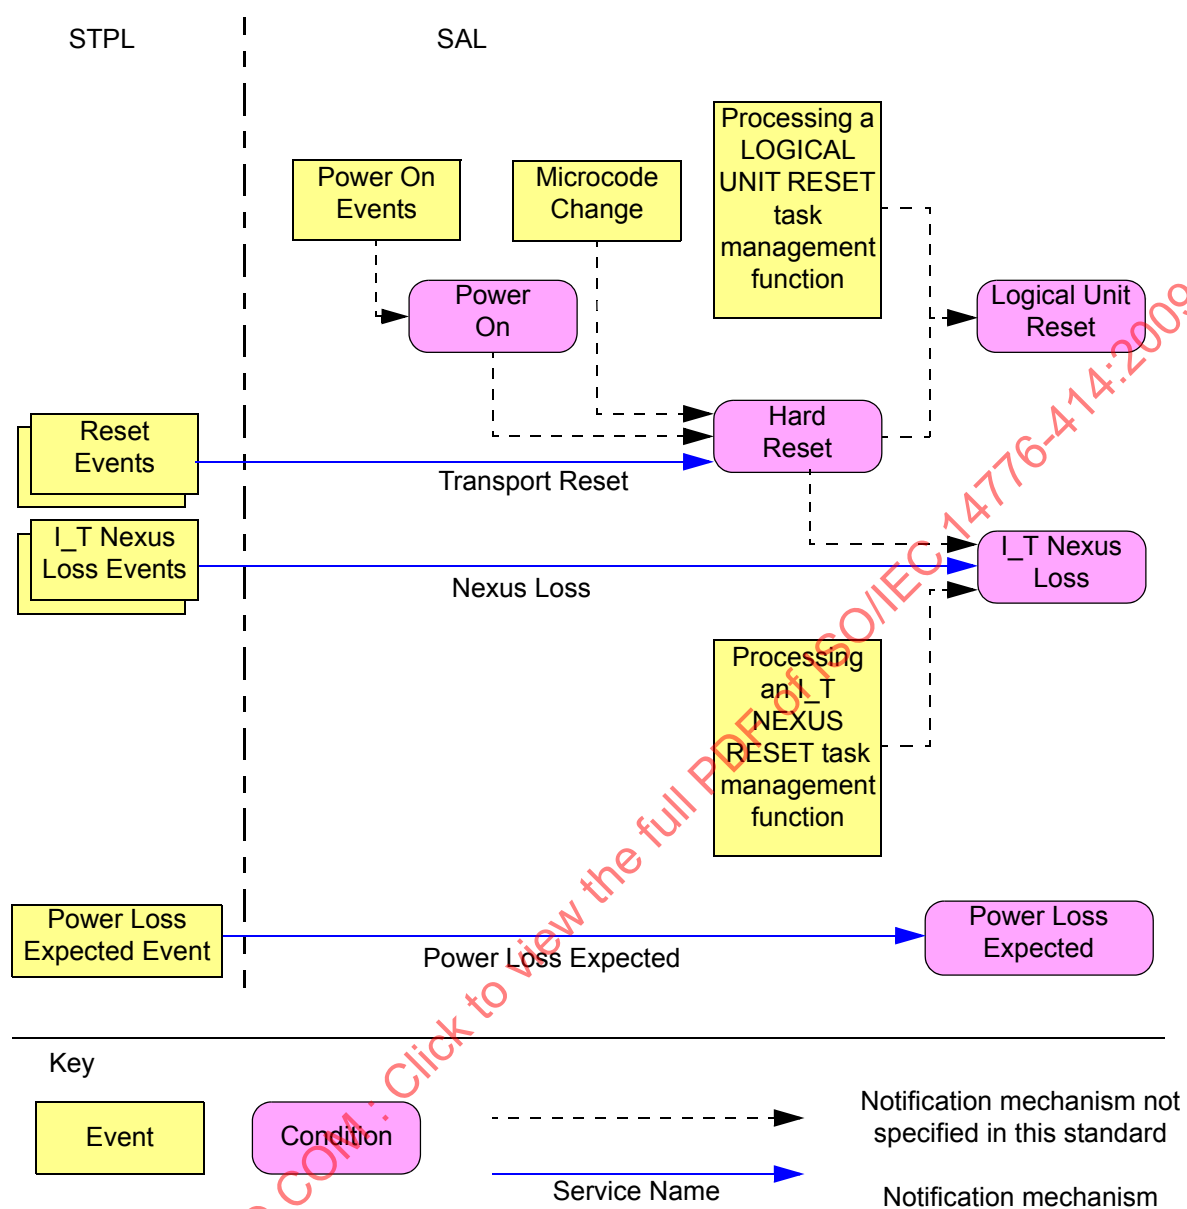

Figure 40 — Events and event notifications for SCSI target devices

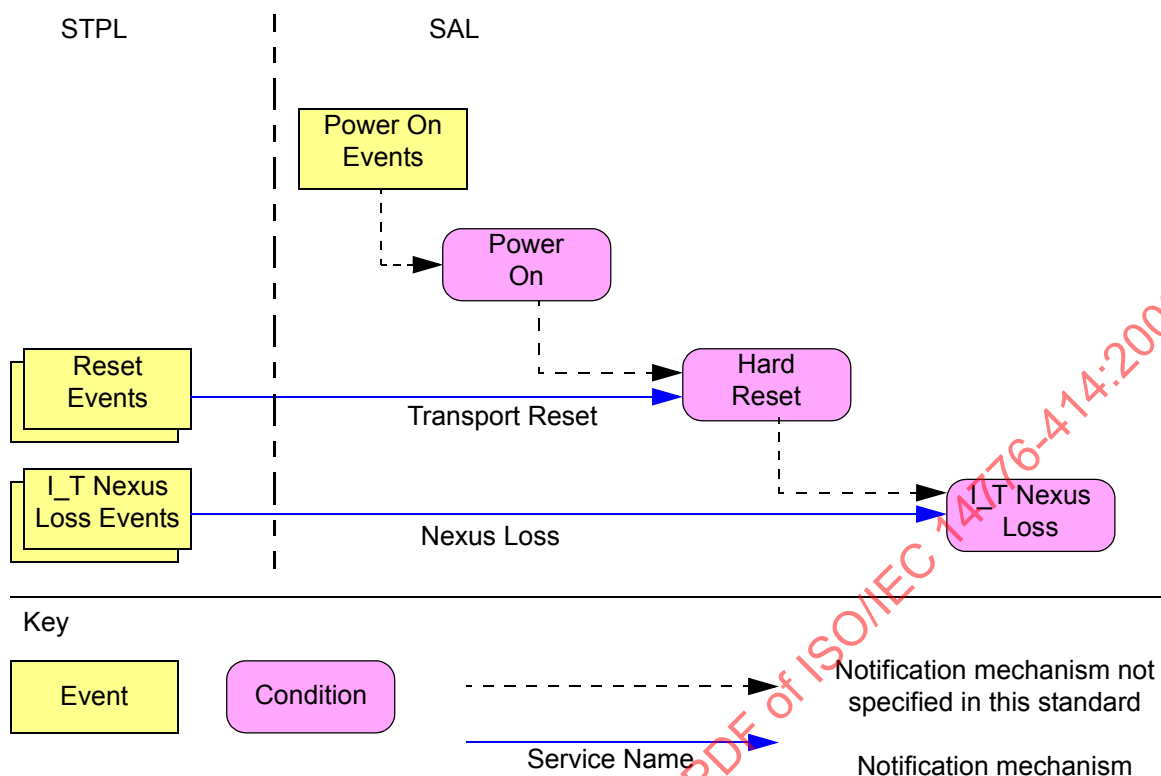

Figure 41 — Events and event notifications for SCSI initiator devices

6.2 Establishing a unit attention condition subsequent to detection of an event

Table 47 shows the additional sense code that a logical unit shall use when a unit attention condition (see 5.14) is established for each of the conditions shown in figure 40 (see 6.1). A SCSI transport protocol may define a more specific additional sense code than SCSI BUS RESET OCCURRED for reset events. The most specific condition in table 47 known to the logical unit should be used to establish the additional sense code for a unit attention.

The unit attention additional sense code specificity order defined in this subclause determines which unit attention condition is allowed to be established when certain conditions occur. The unit attention condition precedence defined in 5.14 determines which unit attention conditions are allowed to clear other unit attention conditions if they have not yet been reported.

Table 47 — Unit attention additional sense codes for events detected by SCSI target devices

Condition	Additional sense code	Specificity
Logical unit is unable to distinguish between the conditions	POWER ON, RESET, OR BUS DEVICE RESET OCCURRED	Lowest
Power on	POWER ON OCCURRED or DEVICE INTERNAL RESET ^a	
Hard reset	SCSI BUS RESET OCCURRED or MICROCODE HAS BEEN CHANGED ^b or protocol specific ^c	
Logical unit reset	BUS DEVICE RESET FUNCTION OCCURRED	
I_T nexus loss	I_T NEXUS LOSS OCCURRED	
Power loss expected	COMMANDS CLEARED BY POWER LOSS NOTIFICATION	Highest
^a Used after a vendor-specific power on event has occurred (e.g., a firmware reboot). ^b Only used if microcode has been changed (see SPC-4). ^c Only used if a protocol-specific reset event has occurred.		

NOTE 17 The names of the unit attention conditions listed in this subclause (e.g., SCSI BUS RESET OCCURRED) are based on usage in SAM-2. The use of these unit attention condition names is not to be interpreted as a description of how the unit attention conditions are represented by any given SCSI transport protocol.

A logical unit should use the I_T NEXUS LOSS OCCURRED additional sense code when establishing a unit attention condition for an I_T nexus loss if:

- the SCSI initiator port to which the sense data is being delivered is the SCSI initiator port that was associated with the I_T nexus loss, and the logical unit has maintained all state information specific to that SCSI initiator port since the I_T nexus loss; or
- the I_T nexus being used to deliver the sense data is the same I_T nexus that was lost, and the logical unit has maintained all state information specific to that I_T nexus since the I_T nexus loss.

Otherwise, the logical unit shall use one of the less specific additional sense codes (e.g., POWER ON OCCURRED) when establishing a unit attention condition for an I_T nexus loss.

6.3 Conditions resulting from SCSI events

6.3.1 Power on

Power on is a SCSI device condition resulting from a power on event. When a SCSI device is powered on, it shall cause a hard reset.

The power on condition applies to both SCSI initiator devices and SCSI target devices.

Power on events include:

- power being applied to the SCSI device; and
- vendor-specific events that cause the SCSI device to behave as if power has been applied (e.g., firmware reboot).

6.3.2 Hard reset

Hard reset is a SCSI device condition resulting from:

- a) a power on condition (see 6.3.1);
- b) microcode change (see SPC-4); or
- c) a reset event indicated by a **Transport Reset** event notification (see 6.4).

The definition of reset events and the notification of their detection is SCSI transport protocol specific.

Each SCSI transport protocol standard that defines reset events shall specify a SCSI target port's protocol specific actions in response to reset events. Each SCSI transport protocol standard that defines reset events should specify when those events result in the delivery of a **Transport Reset** event notification to the SCSI applications layer.

SCSI transport protocols may include reset events that have no SCSI effects (e.g., a Fibre Channel non-initializing loop initialization primitive).

The hard reset condition applies to both SCSI initiator devices and SCSI target devices.

A SCSI target port's response to a hard reset condition shall include a logical unit reset condition (see 6.3.3) for all logical units to which the SCSI target port has access. A hard reset condition shall not affect any other SCSI target ports in the SCSI target device, however, the logical unit reset condition established by a hard reset may affect commands and task management functions that are communicating via other SCSI target ports.

Although the task manager response to task management requests is subject to the presence of access restrictions, as managed by ACCESS CONTROL OUT commands (see SPC-4), a hard reset condition (see 6.3.2) shall not be prevented by access controls.

When a SCSI initiator port detects a hard reset condition, it should terminate all its outstanding **Execute Command** procedure calls and all its outstanding task management procedure calls with a service response of SERVICE DELIVERY OR TARGET FAILURE. A hard reset condition shall not affect any other SCSI initiator ports in the SCSI initiator device, however, the logical unit reset condition established in a SCSI target device by a hard reset may affect commands and task management functions that are communicating via other SCSI initiator ports.

A SCSI port's response to a hard reset condition shall include establishing an I_T nexus loss condition (see 6.3.4) for every I_T nexus associated with that SCSI port.

6.3.3 Logical unit reset

Logical unit reset is a logical unit condition resulting from:

- a) a hard reset condition (see 6.3.2); or
- b) a logical unit reset event indicating that a LOGICAL UNIT RESET task management request (see 7.7) has been processed.

The logical unit reset condition applies only to SCSI target devices.

When responding to a logical unit reset condition, the logical unit shall:

- a) abort all commands as described in 5.6;
- b) terminate all task management functions;
- c) clear all ACA conditions (see 5.9.5) in all task sets in the logical unit;
- d) establish a unit attention condition (see 5.14 and 6.2);
- e) initiate a logical unit reset for all dependent logical units (see 4.6.19.4); and
- f) perform any additional functions required by the applicable command standards.

6.3.4 I_T nexus loss

I_T nexus loss is a SCSI device condition resulting from:

- a) a hard reset condition (see 6.3.2);
- b) an I_T nexus loss event (e.g., logout) indicated by a **Nexus Loss** event notification (see 6.4); or

- c) an I_T nexus loss event indicating that an I_T NEXUS RESET task management request (see 7.6) has been processed.

An I_T nexus loss event is an indication from the SCSI transport protocol to the SAL that an I_T nexus no longer exists. SCSI transport protocols may define I_T nexus loss events.

Each SCSI transport protocol standard that defines I_T nexus loss events should specify when those events result in the delivery of a **Nexus Loss** event notification to the SCSI applications layer.

The I_T nexus loss condition applies to both SCSI initiator devices and SCSI target devices.

When a SCSI target port detects an I_T nexus loss, a **Nexus Loss** event notification indication shall be delivered to each logical unit to which the I_T nexus has access. In response to the resulting I_T nexus loss condition a logical unit shall take the following actions:

- a) abort all commands received on the I_T nexus as described in 5.6;
- b) terminate all task management functions received on the I_T nexus;
- c) clear all ACA conditions (see 5.9.5) associated with the I_T nexus;
- d) establish a unit attention condition for the SCSI initiator port associated with the I_T nexus (see 5.14 and 6.2); and
- e) perform any additional functions required by the applicable command standards.

If the logical unit retains state information for the I_T nexus that is lost, its response to the subsequent I_T nexus re-establishment for the logical unit should include establishing a unit attention with an additional sense code set to I_T NEXUS LOSS OCCURRED.

If the logical unit does not retain state information for the I_T nexus that is lost, it shall consider the subsequent I_T nexus re-establishment, if any, as the formation of a new I_T nexus for which there is no past history (e.g., establish a unit attention with an additional sense code set to POWER ON OCCURRED).

When a SCSI initiator port detects an I_T nexus loss, it should terminate all its outstanding **Execute Command** procedure calls and all its outstanding task management procedure calls for the SCSI target port associated with the I_T nexus with a service response of SERVICE DELIVERY OR TARGET FAILURE.

6.3.5 Power loss expected

Power loss expected is a SCSI device condition resulting from a power loss expected event indicated by a Power Loss Expected event notification (see 6.4).

A power loss expected event is an indication from the SCSI transport protocol to the SAL that power loss may occur within a protocol specific period of time. SCSI transport protocols may define power loss expected events.

Each SCSI transport protocol standard that defines power loss expected events should specify when those events result in the delivery of a Power Loss Expected event notification to the SCSI applications layer.

The power loss expected condition applies only to SCSI target devices and includes the actions performed by a task manager for a CLEAR TASK SET task management function (see 7.5) applied to all task sets.

When a SCSI target port detects a power loss expected, a Power Loss Expected event notification indication shall be delivered to each logical unit to which the I_T nexus has access. In response to the resulting I_T power loss expected condition a logical unit shall take the following actions:

- a) abort all commands and establish a unit attention condition as described in 5.6;
- b) complete all task management functions; and
- c) perform any additional functions required by the applicable SCSI transport protocol standards.

6.4 Event notification SCSI transport protocol services

The SCSI transport protocol services described in this subclause are used by a SCSI initiator port or a SCSI target port to deliver an indication to the SAL that a SCSI event has been detected.

All SCSI transport protocol standards should define the SCSI transport protocol specific requirements for implementing the **Nexus Loss** indication, the **Transport Reset** indication and the **Power Loss Expected** indication described in this subclause and when these indications are to be delivered to the SCSI applications layer.

The **Nexus Loss** indication and the **Transport Reset** indication are defined for both SCSI target devices and SCSI initiator devices.

Indication delivered to device servers, task managers, and application clients:

Nexus Loss (IN (I_T Nexus))

Argument description:

I_T Nexus: The specific I_T nexus that has been detected as lost.

Indication delivered to device servers, task managers, and application clients:

Transport Reset (IN (SCSI Port))

Argument descriptions:

SCSI Port: The specific SCSI port in the SCSI device for which a transport reset was detected.

The **Power Loss Expected** indication is defined for SCSI target devices.

Indication delivered to device servers and task managers:

Power Loss Expected (IN (SCSI Port))

Argument descriptions:

SCSI Port: The specific SCSI port in the SCSI device for which an unexpected power loss was detected.

7 Task management functions

7.1 Task management function procedure calls

An application client requests the processing of a task management function by invoking the SCSI transport protocol services described in 7.12, the collective operation of which is modeled in the following procedure call using the following format:

Service Response = Function name (IN (Nexus), OUT ([Additional Response Information])

The task management function names are summarized in table 48.

Table 48 — Task Management Functions

Task management function (i.e., function name)	Nexus argument	Additional Response Information argument supported	Reference
ABORT TASK	I_T_L_Q Nexus	no	7.2
ABORT TASK SET	I_T_L Nexus	no	7.3
CLEAR ACA	I_T_L Nexus	no	7.4
CLEAR TASK SET	I_T_L Nexus	no	7.5
I_T NEXUS RESET	I_T Nexus	no	7.6
LOGICAL UNIT RESET	I_T_L Nexus	no	7.7
QUERY TASK	I_T_L_Q Nexus	no	7.8
QUERY TASK SET	I_T_L Nexus	no	7.9
QUERY ASYNCHRONOUS EVENT	I_T_L Nexus	yes	7.10

Input arguments:

Nexus: Contains an I_T Nexus argument, I_T_L Nexus argument, or I_T_L_Q Nexus argument (see 4.8) identifying the command or commands affected by the task management function.

I_T Nexus: The I_T nexus (see 4.8) affected by the task management function.

I_T_L Nexus: The I_T_L nexus (see 4.8) affected by the task management function.

I_T_L_Q Nexus: The I_T_L_Q nexus (see 4.8) affected by the task management function.

Output arguments:

Additional Response Information: If supported by the SCSI transport protocol and the logical unit, then three bytes that are returned along with the service response for certain task management functions (e.g., QUERY ASYNCHRONOUS EVENT). SCSI transport protocols may or may not support the Additional Response Information argument. A SCSI transport protocol supporting the Additional Response Information argument may or may not require that logical units accessible through a SCSI target port using that transport protocol support the Additional Response Information argument. All output parameters are invalid.

One of the following SCSI transport protocol specific service responses shall be returned:

FUNCTION COMPLETE:	A task manager response indicating that the requested function is complete. Unless another response is required, the task manager shall return this response upon completion of a task management request supported by the logical unit or SCSI target device to which the request was directed.
FUNCTION SUCCEEDED:	A task manager response indicating that the requested function is supported and completed successfully. This task manager response shall only be used by functions that require notification of success (e.g., QUERY TASK, QUERY TASK SET, or QUERY ASYNCHRONOUS EVENT).
FUNCTION REJECTED:	A task manager response indicating that the requested function is not supported by the logical unit or SCSI target device to which the function was directed.
INCORRECT LOGICAL UNIT NUMBER:	A task router response indicating that the function requested processing for an incorrect logical unit number.
SERVICE DELIVERY OR TARGET FAILURE:	The request was terminated due to a service delivery failure (see 3.1.116) or SCSI target device malfunction. The task manager may or may not have successfully performed the specified function.

Each SCSI transport protocol standard shall define the events for each of these service responses.

The task manager response to task management requests is subject to the presence of access restrictions, as managed by ACCESS CONTROL OUT and ACCESS CONTROL IN commands (see SPC-4), as follows:

- a task management request of ABORT TASK, ABORT TASK SET, CLEAR ACA, I_T NEXUS RESET, QUERY TASK, QUERY TASK SET, or QUERY ASYNCHRONOUS EVENT shall not be affected by the presence of access restrictions;
- a task management request of CLEAR TASK SET or LOGICAL UNIT RESET received from a SCSI initiator port that is denied access to the logical unit, either because it has no access rights or because it is in the pending-enrolled state, shall not cause any changes to the logical unit; and
- the task management function service response shall not be affected by the presence of access restrictions.

7.2 ABORT TASK

Procedure call:

Service Response = ABORT TASK (IN (I_T_L_Q Nexus))

Description:

This function shall be supported by all logical units.

The task manager shall abort the specified command, if it exists, as described in 5.6. Previously established conditions, including mode parameters, reservations, and ACA shall not be changed by the ABORT TASK function.

A response of FUNCTION COMPLETE shall indicate that the command was aborted or was not in the task set. In either case, the SCSI target device shall guarantee that no further requests or responses are sent from the command.

All SCSI transport protocol standards shall support the ABORT TASK task management function.
