#### **Foreword**

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see <a href="https://www.iso.org/directives">www.iso.org/directives</a>).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see <a href="https://www.iso.org/patents">www.iso.org/patents</a>).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: <a href="www.iso.org/iso/foreword.html">www.iso.org/iso/foreword.html</a>.

The committee responsible for this document is ISO/IEC JTC 1, *Information technology*, SC 32, *Data management and interchange*.

This fifth edition of ISO/IEC 9075-3 cancels and replaces the fourth edition (ISO/IEC 9075-3:2008), which has been technically revised.

A list of all parts in the ISO/IEC 9075 series, published under the general title *Information technology* — *Database languages* — *SQL*; can be found on the ISO website.

NOTE The individual parts of multi-part standards are not necessarily published together. New editions of one or more parts can be published without publication of new editions of other parts.

#### Introduction

The organization of this part of ISO/IEC 9075 is as follows:

- 1) Clause 1, "Scope", specifies the scope of this part of ISO/IEC 9075.
- 2) Clause 2, "Normative references", identifies additional standards that, through reference in this part of ISO/IEC 9075, constitute provisions of this part of ISO/IEC 9075.
- 3) Clause 3, "Definitions, notations, and conventions", defines the notations and conventions used in this part of ISO/IEC 9075.
- 4) Clause 4, "Concepts", presents concepts used in the definition of the Call-Level Interface.
- 5) Clause 5, "Call-Level Interface specifications", defines facilities for using SQL through a Call-Level Interface.
- 6) Clause 6, "SQL/CLI routines", defines each of the routines that comprise the Call-Level Interface.
- 7) Clause 7, "Additional data manipulation rules", defines additional rules for data manipulation.
- 8) Clause 8, "Dynamic SQL", defines the SQL dynamic statements.
- 9) Clause 9, "Definition Schema", specifies extensions to the Definition Schema required for support of the Call-Level Interface.
- 10) Clause 10, "Conformance", defines the criteria for conformance to this part of ISO/IEC 9075.
- 11) Annex A, "SQL Conformance Summary", is an informative Annex. It summarizes the conformance requirements of the SQL language.
- 12) Annex B, "Implementation-defined elements", is an informative Annex. It lists those features for which the body of this part of ISO/IEC 9075 states that the syntax, the meaning, the returned results, the effect on SQL-data and/or schemas, or any other behavior is partly or wholly implementation-defined.
- 13) Annex C, "Implementation-dependent elements", is an informative Annex. It lists those features for which the body of this part of ISO/IEC 9075 states that the syntax, the meaning, the returned results, the effect on SQL-data and/or schemas, or any other behavior is partly or wholly implementation-dependent.
- 14) Annex D, "Deprecated features", is an informative Annex. It lists features that the responsible Technical Committee intend will not appear in a future revised version of this part of ISO/IEC 9075.
- 15) Annex E, "Incompatibilities with ISO/IEC 9075:2011 and 9075:2008", is an informative Annex. It lists incompatibilities with the previous version of this part of ISO/IEC 9075.
- 16) Amex F, "SQL feature taxonomy", is an informative Annex. It identifies features of the SQL language specified in this part of ISO/IEC 9075 by an identifier and a short descriptive name. This taxonomy is used to specify conformance.
- 17) Annex G, "Defect reports not addressed in this edition of this part of ISO/IEC 9075", is an informative Annex. It describes the Defect Reports that were known at the time of publication of this part of this International Standard. Each of these problems is a problem carried forward from the previous edition of ISO/IEC 9075. No new problems have been created in the drafting of this edition of this International Standard.

- 18) Annex H, "Typical header files", is an informative Annex. It provides examples of typical definition files for application programs using the SQL Call-Level Interface.
- 19) Annex I, "Sample C programs", is an informative Annex. It provides examples of using the SQL Call-Level Interface in the C programming language.

ad in Clausew pages. A sew page In the text of this part of ISO/IEC 9075, Clauses and Annexes begin new odd-numbered pages, and in Clause 5, "Call-Level Interface specifications", through Clause 10, "Conformance", Subclauses begin new pages. Any resulting blank space is not significant.

#### **Definitions, notations, and conventions**

This Clause modifies Clause 3, "Definitions, notations, and conventions", in ISO/IEC 9075-2.

#### 3.1 **Definitions**

This Subclause modifies Subclause 3.1, "Definitions", in ISO/IEC 9075-2.

#### 3.1.1 **Definitions provided in Part 3**

For the purposes of this document, the following definitions apply.

- 3.1.1.1 data source
- synonym for the SQL-server that is part of the current SQL-connection 3.1.1.2 handle

CLI object returned by an SQL/CLI implementation when a CLI resource is allocated and used by an SQL/CLI application to reference that CLI resource

- 3.1.1.3 inner table second operand of a left outer join or the first operand of a right outer join
- 3.1.1.4 pseudo-column column that is part of a table but is not part of the descriptor for that table NOTE 2 — An example of such a pseudo-column is an implementation-defined row identifier.
- 3.1.1.5 rowset one or more rows retrieved in a single invocation of the Fetch and FetchScroll routines
- 3.1.1.6 SQL/CLI application application that invokes <CLI routine>s specified in this part of ISO/IEC 9075

## Conventions

This Subclause modifies Subclause 3.3, "Conventions", in ISO/IEC 9075-2.

#### 3.2.1 **Specification of routine definitions**

The routines in this document are specified in terms of:

# ISO/IEC 9075-3:2016(E) 3.2 Conventions

- **Function**: A short statement of the purpose of the routine.
- **Definition**: The name of the routine and the name, mode, and data type of each of its parameters.
- General Rules: A specification of the run-time effect of the routine. Where more than one General Rule is used to specify the effect of a routine, the required effect is that which would be obtained by beginning that arwise when the land the full part of the full part with the first General Rule and applying the Rules in numeric sequence until a Rule is applied that specifies or implies a change in sequence or termination of the application of the Rules. Unless otherwise specified or implied by a specific Rule that is applied, application of General Rules terminates when the last in the

#### 4 Concepts

This Clause modifies Clause 4, "Concepts", in ISO/IEC 9075-2.

### 4.1 Introduction to SQL/CLI

This Subclause is modified by Subclause 4.18, "Introduction to SQL/CLI", in ISO/IEC 9075-9.

The Call-Level Interface (SQL/CLI) is a binding style for executing SQL statements. This part of ISO/IEC 9075 provides specifications for routines that:

- Allocate and deallocate resources.
- Control connections to SQL-servers.
- Execute SQL statements using mechanisms similar to dynamic SQL.
- Obtain diagnostic information.
- Control transaction termination.
- Obtain information about the SQL/CLI implementation and the SQL-implementation.

A handle is a CLI object returned by an SQL/CLD implementation when a CLI resource is allocated; the handle is used by an SQL/CLI application to reference that CLI resource. The AllocHandle routine allocates the resources to manage an SQL-environment, an SQL-connection, a CLI descriptor area, or SQL-statement processing; when invoked, it returns an environment handle, a connection handle, a descriptor handle, or a statement handle, respectively. An SQL-connection is allocated in the context of an allocated SQL-environment. CLI descriptor areas and SQL-statements are allocated in the context of an allocated SQL-connection. The FreeHandle routine deallocates a specified resource. The AllocConnect, AllocEnv, and AllocStmt routines can be used to allocate the resources to manage an SQL-connection, an SQL-environment, and SQL-statement processing, respectively, instead of using the AllocHandle routine. The FreeConnect, FreeEnv, and FreeStmt routines can be used to deallocate the specific resource instead of using FreeHandle.

Each allocated SQL-environment has an attribute that determines whether output character strings are null terminated by the SQL/CLI implementation. The SQL/CLI application can set the value of this attribute by using the routine SetEnvAttr and can retrieve the current value of the attribute by using the routine GetEnvAttr.

The Connect routine establishes an SQL-connection, which becomes the *current SQL-connection*. The Disconnect routine terminates an established SQL-connection. Switching between established SQL-connections occurs automatically whenever the SQL/CLI application switches processing to a dormant SQL-connection, which then becomes the *current SQL-connection*.

The ExecDirect routine is used for a one-time execution of an SQL-statement. The Prepare routine is used to prepare an SQL-statement for subsequent execution using the Execute routine. In all three cases, the executed SQL-statement can contain dynamic parameters.

#### ISO/IEC 9075-3:2016(E) 4.1 Introduction to SQL/CLI

The interface for a description of dynamic parameters, dynamic parameter values, the result columns of a <dynamic select statement> or <dynamic single row select statement>, and the target specifications for the result columns is a CLI descriptor area. A CLI descriptor area for each type of interface is automatically allocated when an SQL-statement is allocated. The SQL/CLI application may allocate additional CLI descriptor areas and nominate them for use as the interface for the description of dynamic parameter values or the description of target specifications by using the routine SetStmtAttr. The SQL/CLI application can determine the handle value of the CLI descriptor area currently being used for a specific interface by using the routine GetStmtAttr. The GetDescField and GetDescRec routines enable information to be retrieved from a CLI descriptor area. The CopyDesc routine enables the contents of a CLI descriptor area to be copied to another CLI descriptor area.

When a <dynamic select statement> or <dynamic single row select statement> is prepared or executed immediately, a description of the result columns is automatically provided in the applicable CLI implementation descriptor area. In this case, the SQL/CLI application may additionally retrieve information by using the DescribeCol and/or the ColAttribute routine to obtain a description of a single result column and by using the NumResultCols routine to obtain a count of the number of result columns. The SQL/CLI application sets values in the CLI application descriptor area for the description of the corresponding target specifications either explicitly, by using the routine SetDescField and SetDescRec, or implicitly, by using the routine BindCol.

When an SQL-statement is prepared or executed immediately, a description of the dynamic parameters is automatically provided in the applicable CLI implementation descriptor area if this facility is supported by the current SQL-connection. An attribute associated with the allocated SQL-connection indicates whether this facility is supported. The value of the attribute may be retrieved using the routine GetConnectAttr. Regardless of whether automatic description is supported, all dynamic input and input/output parameters shall be defined in the application descriptor area before SQL-statement execution. This can be done either explicitly, by using the routines SetDescField and SetDescRec, or implicitly, by using the routine BindParameter. The value of a dynamic input or input/output parameter may be established before SQL-statement execution (immediate parameter value) or may be provided during SQL-statement execution (deferred parameter value). Its description in the CLI descriptor area determines which method is in use. The ParamData routine is used to cycle through and process deferred input and input/output parameter values. The PutData routine is used to provide the deferred values. The PutData routine also enables the values of character string input and input/output parameters to be provided piece by piece.

Before a <call statement> is prepared or executed immediately, the SQL/CLI application may choose whether or not to bind any dynamic output parameters in the CLI application descriptor area. This can be done either explicitly, by using the routines SetDescField and SetDescRec, or implicitly, by using the routine BindParameter. After execution of the statement, values of unbound output and input/output parameters can be individually retrieved using the GetParamData routine. The GetParamData routine also enables the retrieval of the values of character and binary string output and input/output parameters to be accomplished piece by piece.

When a <dynamic select statement> or <dynamic single row select statement> is executed, a CLI prepared cursor is implicitly declared and opened. The name of the cursor is determined by the cursor name property associated with the allocated SQL-statement, which can be supplied by the SQL/CLI application by using the routine SetCursorName. If a cursor name is not supplied by the SQL/CLI application, the value of the cursor name property associated with the allocated SQL-statement is an implementation-dependent cursor name. The cursor name property associated with the allocated SQL-statement can be retrieved by using the GetCursorName routine. The operational sensitivity, scrollability, and holdability properties of a CLI prepared cursor are determined by the CURSOR SENSITIVITY, CURSOR SCROLLABLE, and CURSOR HOLDABLE attributes, respectively, of the allocated SQL-statement at the time the CLI cursor is declared and opened. The SQL/CLI application can set the values of these attributes by using the SetStmtAttr routine and can retrieve the current values of these attributes by using the GetStmtAttr routine. The operational returnability property of a CLI prepared cursor is implementation-defined.

The Fetch and FetchScroll routines are used to position an open CLI cursor on a row and to retrieve the values of bound columns for that row. A bound column is one whose target specification in the specified CLI descriptor area defines a location for the target value. The Fetch routine always positions the open CLI cursor on the next row, whereas the FetchScroll routine may be used to position the open CLI cursor on any of its rows. The use of FetchScroll with a FetchOrientation other than NEXT is permitted only if the operational scrollability property of the CLI cursor is SCROLL. The Fetch and FetchScroll routines can also retrieve multiple rows in a single call; the set of rows thus retrieved is called a *rowset*. This is accomplished by setting the ARRAY\_SIZE field of the applicable application row descriptor to the desired number of rows. Note that the single row fetch is just a special case of multi-row fetch, where the rowset size is 1 (one).

Values for unbound columns can be individually retrieved by using the GetData routine. The GetData routine also enables the retrieval of the values of character and binary string columns to be accomplished piece by piece. The current row of a CLI cursor is a row of the current rowset indicated by the CURRENT OF POSITION attribute of the allocated SQL-statement associated with the CLI cursor. The current row can be deleted or updated by executing a preparable dynamic delete statement: positioned> or a preparable dynamic update statement: positioned>, respectively, for that CLI cursor under a different allocated SQL-statement to the one under which the CLI cursor was opened. The CloseCursor routine enables a CLI cursor to be closed.

Result sets can be returned to the SQL/CLI application as a result of invoking the Execute or ExecDirect routine, supplying a statement handle whose current statement is a <call statement. If the <call statement invokes an SQL-invoked procedure SIP that returns a non-empty result set sequence RSS, then a CLI procedural result cursor is automatically associated with the statement handle. The result set of this CLI procedural result cursor is the first result set of RSS. The SQL/CLI application can learn that a cursor has been automatically opened by invoking NumResultCols to determine if the ColumnCount is positive. If there is more than one result set in the result set sequence, then the others can be processed one at a time or in parallel. To process the result sets one at a time, once the processing of a given result set is complete, the MoreResults routine is used to determine whether there are any additional result sets and, if there are, to position the CLI procedural result cursor before the first row in the next result set. To process the result sets in parallel, the NextResult routine is used to determine whether there are any additional result sets and, if there are, to position a CLI procedural result cursor associated with another statement handle before the first row in the next result set.

When a CLI procedural result cursor is associated with a result set, the operational sensitivity, scrollability, and holdability properties of the CLI procedural result cursor are those of the result set as it was received from the stored procedure. (The CURSOR SENSITIVITY, CURSOR SCROLLABLE, and CURSOR HOLDABLE attributes of the allocated SQL-statement are ignored; using SetStmtAttr to set these attributes has no effect on the corresponding operational properties of a CLI procedural result cursor.) The operational returnability property of a CLI procedural result cursor is implementation-defined. A CLI procedural result cursor is not updatable. Otherwise, a CLI procedural result cursor is processed in the same way as a CLI prepared cursor.

Special routines, called *catalog routines* are available to return result sets from the Information Schema. These routines are:

- Column Privileges: Returns a list of the privileges held on the columns whose names adhere to the requested pattern(s) within a single specified table. Most of this information can also be obtained by using the ExecDirect routine to issue an appropriate query on the COLUMN\_PRIVILEGES view of the Information Schema.
- Columns: Returns the column names and attributes for all columns whose names adhere to the requested pattern(s). Most of this information can also be obtained by using the ExecDirect routine to issue an appropriate query on the COLUMNS view of the Information Schema.
- ForeignKeys: Returns either the primary key of a single specified table together with the foreign keys in all other tables that reference that primary key or the foreign keys of a single specified table together with

#### ISO/IEC 9075-3:2016(E) 4.1 Introduction to SQL/CLI

all the primary and unique keys in all other tables that are referenced by those foreign keys. Most of this information can also be obtained by using the ExecDirect routine to issue an appropriate query on the TABLE\_CONSTRAINTS view and the REFERENTIAL\_CONSTRAINTS view of the Information Schema.

- PrimaryKeys: Returns a list of the columns that constitute the primary key of a single specified table. Most of this information can also be obtained by using the ExecDirect routine to issue an appropriate query on the TABLE\_CONSTRAINTS view and the KEY\_COLUMN\_USAGE view of the Information Schema.
- SpecialColumns: Returns a list of the columns which can uniquely identify any row within a single specified table. Most of this information can also be obtained by using the ExecDirect routine to issue an appropriate query on the COLUMNS view of the Information Schema.
- Tables: Returns information about the tables whose names adhere to the requested pattern(s) and type(s). Most of this information can also be obtained by using the ExecDirect routine to issue an appropriate query on the TABLES view of the Information Schema.
- TablePrivileges: Returns a list of the privileges held on tables whose names adhere to the requested pattern(s). Most of this information can also be obtained by using the ExecDirect routine to issue an appropriate query on the TABLE\_PRIVILEGES view of the Information Schema.

These special routines are only available for a small portion of the metadata that is available in the Information Schema. Other metadata (for example, that about SQL-invoked routines, triggers, and user-defined types) can be obtained by executing appropriate queries on the views of the Information Schema.

The GetPosition, GetLength, and GetSubString routines can each be used with its own independent statement handle to access a string value at the server that is represented by a Large Object locator in order to do any of the following:

- The GetPosition routine may be used to determine whether a given substring exists within that string and, if it does, to obtain an integer value that indicates the starting position of the first appearance of the given substring.
- The GetLength routine may be used to obtain the length of that string as an integer.
- The GetSubString routine may be used to retrieve a portion of a string, or alternatively, to create a new Large Object value at the server which is a portion of the string and to return a Large Object locator that represents that value.

The Error, GetDiagField, and GetDiagRec routines obtain diagnostic information about the most recent routine operating on a particular resource. The Error routine always retrieves information from the next status record, whereas the GetDiagField and GetDiagRec routines may be used to retrieve information from any status record.

The number of rows affected by the last executed SQL-statement can be obtained by using the RowCount or GetDiagField routine.

An SQL-transaction is terminated by using the EndTran routine. An SQL-transaction is implicitly initiated whenever a CLI routine is invoked that requires the context of an SQL-transaction and no SQL-transaction is active. An SQL-transaction is explicitly started, and its characteristics set, by using the StartTran routine.

NOTE 3 — Applications are prohibited from using the ExecDirect or Execute routines to execute <start transaction statement>s, <commit statement>s, <rollback statement>s, and <release savepoint statement>s.

The Cancel routine is used to cancel the execution of a concurrently executing SQL/CLI routine; it is also used to terminate the processing of deferred parameter values and the execution of the associated SQL-statement.

The GetFeatureInfo, GetFunctions, GetInfo, GetSessionInfo, and GetTypeInfo routines are used to obtain information about the implementation. The DataSources routine returns a list of names that identify SQL-servers to which the SQL/CLI application may be able to connect and returns a description of each such SQL-server.

#### 4.2 Return codes

The execution of a CLI routine causes one or more conditions to be raised. The status of the execution is indicated by a code that is returned either as the result of invoking a CLI routine that is a CLI function or as the value of the ReturnCode argument of a CLI routine that is a CLI procedure.

The return code values and meanings are described in the following list. If more than one return code is possible, then the one appearing later in the list is the one returned.

- A value of 0 (zero) indicates **Success**. The CLI routine executed successfully
- A value of 1 (one) indicates **Success with information**. The CLI routine executed successfully but a completion condition was raised: *warning*.
- A value of 100 indicates **No data found**. The CLI routine executed successfully but a completion condition was raised: *no data*.
- A value of 99 indicates **Data needed**. The CLI routine did not complete its execution because additional data is needed. An exception condition was raised: *CLI-specific condition dynamic parameter value needed*.
- A value of -1 indicates Error. The CLI routine did not execute successfully. An exception condition other than CLI-specific condition invalid handle or CLI-specific condition dynamic parameter value needed was raised.
- A value of –2 indicates **Invalid handle** The CLI routine did not execute successfully because an exception condition was raised: *CLI-specific condition invalid handle*.

After the execution of a CLI routine, the values of every output argument that corresponds to an output parameter whose value is not explicitly defined by this part of ISO/IEC 9075 is implementation-dependent.

In addition to providing the return code, for all CLI routines other than Error, GetDiagField, and GetDiagRec, the SQL/CLI implementation records information about completion conditions and about exception conditions other than *CLI-specific condition* — *invalid handle* in the diagnostics area associated with the resource being utilized. The *resource being utilized* by a routine is the resource identified by its input handle. In the case of CopyDesc, which takes two input handles, the resource being utilized is the one identified by TargetDescHandle.

## 4.3 Diagnostics areas in SQL/CLI

Each diagnostics area comprises header information consisting of fields that contain general information relating to the routine that was executed and zero (0) or more status records containing information about individual conditions that occurred during the execution of the CLI routine. A condition that causes a status record to be generated is referred to as a *status condition*.

At the beginning of the execution of any CLI routine other than Error, GetDiagField, and GetDiagRec, the diagnostics area for the resource being utilized is emptied. If the execution of such a routine does not result in

#### 4.3 Diagnostics areas in SQL/CLI

the exception condition *CLI-specific condition* — invalid handle or the exception condition *CLI-specific condition* — dynamic parameter value needed, then:

- Header information is generated in the diagnostics area.
- If the routine's return code indicates **Success**, then no status records are generated.
- If the routine's return code indicates **Success with information** or **Error**, then one or more status records are generated.
- If the routine's return code indicates **No data found**, then no status record is generated corresponding to SQLSTATE value '02000' but there may be status records generated corresponding to SQLSTATE value '02nnn', where 'nnn' is an implementation-defined subclass code.

When Fetch or FetchScroll is invoked, the resulting rowset has one or more rows, and exceptions or warnings are generated, then the corresponding records in the diagnostics area have the ROW NUMBER field set to the row number of the row in the rowset associated with the exceptions or warnings. If a status record does not correspond to any row in the rowset, or the record is generated as a result of calling a routine other than Fetch or FetchScroll, the ROW\_NUMBER field is set to zero. The COLUMN\_NUMBER field of the status record contains the column number (if any) to which this exception or warning condition applies. If the status record does not apply to any column, then COLUMN\_NUMBER is set to zero.

Status records in the diagnostics area are ordered by ROW NUMBER. If multiple status records are generated for the same ROW\_NUMBER value, then the order in which the second and subsequent of those status records appear is implementation-dependent. Which of those status records appears first is also implementationdependent, except that:

- Status records corresponding to transaction rollback have precedence over status records corresponding to other exceptions, which in turn have precedence over status records corresponding to the completion condition no data, which in turn have precedence over status records corresponding to the completion condition warning.
- Apart from any status records corresponding to an implementation-specified *no data*, any status record corresponding to an implementation-specified condition that duplicates, in whole or in part, a condition defined in this part of ISO/IEC 9075 shall not be the first status record.

The routines GetDiagField and GetDiagRec retrieve information from a diagnostics area. The SQL/CLI application identifies which diagnostics area is to be accessed by providing the handle of the relevant resource as an input argument. The routines return a result code but do not modify the identified diagnostics area.

The Error routine also retrieves information from a diagnostics area. The Error routine retrieves the status records in the identified diagnostics area one at a time but does not permit already processed status records to be retrieved. Error returns a result code but does not modify the identified diagnostics area.

The Row Count routine retrieves the ROW COUNT field from the diagnostics area for the specified statement handle RowCount returns a result code and may cause status records to be generated.

A CLI diagnostics area comprises the header fields specified under "Header fields" Table 1, "Header fields in SQL/CLI diagnostics areas", as well as zero (0) or more status records, each of which comprises the fields specified under "Status record fields" Table 2, "Status record fields in SQL/CLI diagnostics areas".

Table 1 — Header fields in SQL/CLI diagnostics areas

All diagnostics area fields specified in other parts of ISO/IEC 9075 that are not included in this table are not applicable to SQL/CLI.

#### 4.3.1 Setting of ROW\_NUMBER and COLUMN\_NUMBER fields

Except where otherwise specified in this part of ISO/IEC 9075, the ROW\_NUMBER and COLUMN\_NUMBER fields in a status record are always 0 (zero).

#### 4.4 Miscellaneous characteristics

#### 4.4.1 Handles

The AllocHandle routine returns a handle that uniquely identifies the allocated resource. Although the data type of a handle parameter is INTEGER, its value has no meaning in any other context and should not be used as a numeric operand or modified in any way.

In general, if the related resource cannot be allocated, then a handle value of zero is returned. However, even if a resource has been successfully allocated, processing of that resource can subsequently fail due to memory constraints as follows:

- If additional memory is required but is not available, then an exception condition is raised: *CLI-specific condition memory allocation error*.
- If previously allocated memory cannot be accessed, then an exception condition is raised: CLI-specific condition memory management error.

NOTE 4 — No diagnostic information is generated in this case.

The validity of a handle in a compilation unit other than the one in which the identified resource was allocated is implementation-defined.

Specifying (the address of) a valid handle as the output handle for an invocation of AllocHandle does not have the effect of reinitializing the identified resource. Instead, a new resource is allocated and a new handle value overwrites the old one.

#### 4.4.2 Null terminated strings

An input character string provided by the SQL/CLI application may be terminated by the implementation-defined null character that terminates C character strings. If this technique is used, the application may set the

#### 4.4 Miscellaneous characteristics

associated length argument to either the length of the string excluding the null terminator or to -3, indicating NULL TERMINATED.

If the NULL TERMINATION attribute for the SQL-environment is <u>True</u>, then all output character strings returned by the SQL/CLI implementation are terminated by the implementation-defined null character that terminates C character strings. If the NULL TERMINATION attribute is <u>False</u>, then output character strings are not null terminated.

#### 4.4.3 Null pointers

If the programming language of the invoking SQL/CLI application supports pointers, then the SQL/CLI application may provide a zero-valued pointer, referred to as a null pointer, in the following circumstances:

- In lieu of an output argument that is to receive the length of a returned character string. This indicates that the SQL/CLI application wishes to prohibit the return of this information.
- In lieu of other output arguments where specifically allowed by this part of ISO/IEC 9075. This indicates that the SQL/CLI application wishes to prohibit the return of this information.
- In lieu of input arguments where specifically allowed by this part of ISO/IEC 9075. The semantics of such a specification depend on the context.

If the SQL/CLI application provides a null pointer in any other circumstances, then an exception condition is raised: *CLI-specific condition* — *invalid use of null pointer*.

If the NULL TERMINATION attribute for the SQL-environment is *False*, then specifying a zero buffer size for an output argument is equivalent to specifying a null pointer for that output argument.

#### 4.4.4 Environment attributes

Environment attributes are associated with each allocated SQL-environment and affect the behavior of CLI functions in that SQL-environment.

The GetEnvAttr routine enables the SQL/CLI application to determine the current value of a specific attribute. For attributes that may be set by the user, the SetEnvAttr routine enables the SQL/CLI application to set the value of a specific attribute. Attribute values may be set by the SQL/CLI application whenever there are no SQL-connections allocated within the SQL-environment.

Table 16, "Codes used for environment attributes", and Table 20, "Data types of attributes", in Subclause 5.19, "Other tables associated with CLI", indicate for each attribute its name, code value, data type, possible values, and whether the attribute may be set using SetEnvAttr.

The NULL TERMINATION attribute determines whether output character strings are null terminated by the SOL/CLI implementation. The attribute is set to *True* when an SOL-environment is allocated.

#### 4.4.5 Connection attributes

Connection attributes are associated with each allocated SQL-connection and affect the behavior of CLI functions operating in the context of that allocated SQL-connection.

The GetConnectAttr routine enables the SQL/CLI application to determine the current value of a specific connection attribute. For connection attributes that may be set by the user, the SetConnectAttr routine enables the SQL/CLI application to set the value of a specific connection attribute.

Table 17, "Codes used for connection attributes", and Table 20, "Data types of attributes", in Subclause 5.19, "Other tables associated with CLI", indicate for each connection attribute its name, code value, data type, possible values and whether the connection attribute may be set using SetConnectAttr.

The POPULATE IPD attribute determines whether the SQL/CLI implementation will populate the implementation parameter descriptor with an item descriptor area for each <dynamic parameter specification> when an SQL-statement is prepared or executed immediately. The POPULATE IPD attribute is automatically set each time an SQL-connection is established for the allocated SQL-connection.

The SAVEPOINT NAME connection attribute specifies the savepoint to be referenced in an invocation of the EndTran routine that uses the SAVEPOINT NAME ROLLBACK or SAVEPOINT NAME RELEASE CompletionType, respectively. The SAVEPOINT NAME attribute is set to a zero-length string when the SQL-connection is allocated.

#### 4.4.6 Statement attributes

Statement attributes are associated with each allocated SQL-statement and affect the processing of SQL-statements under that allocated SQL-statement.

The GetStmtAttr routine enables the SQL/CLI application to determine the current value of a specific statement attribute. For statement attributes that may be set by the user, the SetStmtAttr routine enables the SQL/CLI application to set the value of a specific statement attribute.

Table 18, "Codes used for statement attributes", and Table 20, "Data types of attributes", in Subclause 5.19, "Other tables associated with CLI", indicate for each statement attribute its name, code value, data type, possible values, and whether the statement attribute may be set by using SetStmtAttr.

The APD HANDLE statement attribute is the value of the handle of the current application parameter descriptor for the allocated SQL-statement. The statement attribute is set to the value of the handle of the automatically allocated application parameter descriptor when the SQL-statement is allocated.

The ARD HANDLE statement attribute is the value of the handle of the current application row descriptor for the allocated SQL-statement. The statement attribute is set to the value of the handle of the automatically allocated application row descriptor when the SQL-statement is allocated.

The IPD HANDLE statement attribute is the value of the handle of the implementation parameter descriptor associated with the allocated SQL-statement. The statement attribute is set to the value of the handle of the automatically allocated implementation parameter descriptor when the SQL-statement is allocated.

The IRD HANDLE statement attribute is the value of the handle of the implementation row descriptor associated with the allocated SQL-statement. The statement attribute is set to the value of the handle of the automatically allocated implementation row descriptor when the SQL-statement is allocated.

#### 4.4 Miscellaneous characteristics

The CURSOR SCROLLABLE statement attribute determines the *scrollability* of the CLI prepared cursor implicitly declared when Execute or ExecDirect are invoked. The statement attribute is set to NONSCROLLABLE when the SQL-statement is allocated.

The CURSOR SENSITIVITY statement attribute determines the *sensitivity* to changes of the CLI prepared cursor implicitly declared when Execute or ExecDirect are invoked. The statement attribute is set to ASENSITIVE when the SQL-statement is allocated.

The CURSOR HOLDABLE statement attribute determines the *holdability* of the CLI prepared cursor implicitly declared when Execute or ExecDirect are invoked. The statement attribute is set to HOLDABLE or NONHOLDABLE when the statement is allocated, depending on the values of the CURSOR COMMIT BEHAVIOR item used by the GetInfo routine.

Whether or not a CLI cursor is returnable is implementation-defined.

The statement attribute CURRENT OF POSITION identifies the row in the rowset to which a positioned update or delete operation applies. This is set to 1 (one) when an SQL-statement is initially allocated. It is reset to 1 (one) whenever Fetch or FetchScroll are successfully executed when the ARRAY SIZE is 1 (one) or the cursor is scrollable; otherwise, it is set to an implementation-defined value indicating the current row within the rowset.

The NEST DESCRIPTOR statement attribute determines whether nested descriptor items are permitted in a CLI descriptor. Nested descriptor items are used to describe ROW, ARRAY, and MULTISET data types. The statement attribute is set to FALSE when the SQL-statement is allocated.

#### 4.4.7 CLI descriptor areas

A *CLI descriptor area* provides an interface for a description of <dynamic parameter specification>s, <dynamic parameter specification> values, result columns of <dynamic select statement>s and <dynamic select statement>s, or <target specification>s for the result columns.

Each descriptor area comprises *header fields* and zero or more *item descriptor areas*. The header fields are specified in Table 6, "Fields in SQL/CLI row and parameter descriptor areas". The header fields include a COUNT field that indicates the number of item descriptor areas and an ALLOC\_TYPE field that indicates whether the CLI descriptor area was allocated by the user or automatically allocated by the SQL/CLI implementation.

The header fields include ARRAY\_SIZE, ARRAY\_STATUS\_POINTER, and ROWS\_PROCESSED\_POINTER. These three fields are used to support the fetching of multiple rows with one invocation of Fetch or FetchScroll.

Each CLI item descriptor area consists of the fields specified following "Status record fields" in Table 6, "Fields in SQL/CLI row and parameter descriptor areas".

The CLI descriptor areas for the four interface types are referred to as an *implementation parameter descriptor* (IPD), an *application parameter descriptor* (APD), an *implementation row descriptor* (IRD), and an *application row descriptor* (ARD), respectively. IPDs and IRDs are collectively known as *implementation descriptor areas*; APDs and ARDs are collectively known as *application descriptor areas*.

When an SQL-statement is allocated, a CLI descriptor area of each type is automatically allocated by the SQL/CLI implementation. The ALLOC\_TYPE fields for these CLI descriptor areas are set to indicate AUTOMATIC. A CLI descriptor area allocated by the user has its ALLOC\_TYPE field set to indicate USER, and can only be used as an APD or ARD. The handle values of the IPD, IRD, current APD, and current ARD are attributes of the allocated SQL-statement. The SQL/CLI application can determine the current values of

these attributes by using the routine GetStmtAttr. The current APD and ARD are initially the automatically-allocated APD and ARD, respectively, but can subsequently be changed by changing the corresponding attribute value using the routine SetStmtAttr.

The routines GetDescField and GetDescRec enable information to be retrieved from any CLI descriptor area. The routines SetDescField and SetDescRec enable information to be set in any CLI descriptor area except an IRD. The routine BindCol implicitly sets information in the current ARD. The routine BindParameter implicitly sets information in the current IPD. The CopyDesc routine enables the contents of any CLI descriptor area to be copied to any CLI descriptor area except an IRD.

NOTE 5 — Although there is no need to set a DATA\_POINTER field in the IPD to align with the consistency check that applies in the case of an APD or ARD, setting this field causes the item descriptor area to be validated.

#### 4.4.8 Obtaining diagnostics during multi-row fetch

When Fetch or FetchScroll is used to fetch a rowset, exceptions or warnings may be raised during the retrieval of one or more rows in the rowset. The status of each row (that is, information about whether that row in the rowset was successfully retrieved or not) is available in the array addressed by the ARRAY\_STATUS\_POINTER field of the applicable IRD. The cardinality of this array is the same as the ARRAY\_SIZE field of the corresponding ARD. For each row in the rowset, the corresponding element of this array has one of the following values:

- A value of 0 (zero) indicates **Row success**, meaning that the row was fetched successfully.
- A value of 6 indicates Row success with information, meaning that the row was fetched successfully, but a completion condition was raised: warning
- A value of 3 indicates **No row**, meaning that there is no row at this position in the rowset. This condition occurs when a partial rowset is retrieved because the result set ended.
- A value of 5 indicates Row error, meaning that the row was not fetched successfully and an exception condition was raised.

Each **Row success with information** or **Row Error** generates one or more status records in the diagnostics area. The ROW\_NUMBER field for each status record has the value of the row position within the rowset to which this status record corresponds.

# 4.5 SQL-invoked routines

This Subclause modifies Subclause 4.33, "SQL-invoked routines", in ISO/IEC 9075-2.

#### 4.5.1 Result sets returned by SQL-invoked procedures

This Subclause modifies Subclause 4.33.6, "Result sets returned by SQL-invoked procedures", in ISO/IEC 9075-2.

#### ISO/IEC 9075-3:2016(E) 4.5 SQL-invoked routines

— Insert a new list element in the 7th paragraph The current rowset, consisting of a contiguous subsequence of the sequence of rows. The current rowset may be an empty subsequence located before a specific row, or an empty subsequence located after the last row of the sequence of rows.

NOTE 6 — The position of the result set is a position within the current rowset of the result set, as indicated by the SQL-statement attribute CURRENT OF POSITION. If the value of this attribute does not indicate a row of the result set, then there is no current row.

#### 4.6 Cursors

This Subclause modifies Subclause 4.38, "Cursors", in ISO/IEC 9075-2.

#### 4.6.1 General description of cursors

This Subclause modifies Subclause 4.38.1, "General description of cursors", in ISO/IEC 9075-2.

Insert after 3rd paragraph A *CLI cursor* is a cursor created by the SQK/CLI implementation and associated with an allocated SQL-statement. If the allocated SQL-statement is processing a <dynamic select statement> or a <dynamic single row select statement>, then the CLI cursor is a *CLI prepared cursor*. If the CLI cursor is processing a result set returned by an SQL-invoked procedure, then the CLI cursor is a *CLI procedural result cursor*.

Replace 1st list item of the 5th paragraph

The kind of cursor (standing, declared dynamic, extended dynamic, received, PTF dynamic, CLI prepared, or CLI procedural result).

Insert after 2nd list item in 3rd list item of the 5th paragraph

• If the cursor is a CLI cursor, then a <cursor name>.

Insert after 5th list item in 4th list item of the 5th paragraph

• If the cursor is a CLI cursor, then the allocated SQL-statement associated with the cursor.

# 4.7 Client-server operation

This Subclause modifies Subclause 4.45, "Client-server operation", in ISO/IEC 9075-2.

Insert this paragraph | If the execution of a CLI routine causes the implicit or explicit execution of an <SQL procedure statement> by an SQL-server, diagnostic information is passed in an implementation-dependent manner to the SQL-client and then into the appropriate diagnostics area. The effect on diagnostic information of incompatibilities between the character repertoires supported by the SQL-client and the SQL-server is implementation-dependent.

### 5 Call-Level Interface specifications

#### 5.1

This Subclause is modified by Subclause 19.1, "<CLI routine>", in ISO/IEC 9075-9.

#### **Function**

Describe SQL/CLI routines in a generic fashion.

#### **Format**

```
09 <CLI routine> ::=
<CLI routine name> ::=
<CLI name prefix> ::=
<CLI by-reference prefix> ::=
<CLI by-value prefix> ::=
<CLI generic name> ::=
  BindParameter
  Cancel
 CloseCursor
 | Colattribute
 | ColumnPrivileges
  Columns
 Connect
 CopyDesc
  DataSources
  DescribeCol
  Disconnect
  EndTran
  Error
```

ExecDirect

#### ISO/IEC 9075-3:2016(E) 5.1 <CLI routine>

```
Execute
   Fetch
   FetchScroll

```

#### **Syntax Rules**

- 301EC 9075.3:2016 1) <CLI routine> is a pre-defined routine written in a programming language that is invoked by a compilation unit of the same programming language. Let HL be that programming language.
- 2) <CLI routine> that contains a <CLI returns clause> is called a CLI function. A <CLI routine> that does not contain a <CLI returns clause> is called a *CLI procedure*.
- 3) There shall be no <separator> between the <CLI name@refix> and the <CLI generic name>.
- For each CLI function CF, there is a corresponding CLI procedure CP, with the same <CLI routine name>. The <CLI parameter list> for CP is the same as the <CLI parameter list> for CF but with the following additional <CLI parameter declaration>:

ReturnCode OUT SMALLINT

- 5) HL shall support either the invocation of CF or the invocation of CP. It is implementation-defined which is supported.
- 6) Case:
  - a) If <CLI parameter mode> is IN, then the parameter is an input parameter. The value of an input argument is established when a CLI routine is invoked.
  - b) If <CLI parameter mode> is OUT, then the parameter is an *output parameter*. The value of an output argument is established when a CLI routine is executed.
  - c) If CLI parameter mode> is DEFIN, then the parameter is a deferred input parameter. The value of a deferred input argument for a CLI routine R is not established when R is invoked, but subsequently during the execution of a related CLI routine.
  - d) If <CLI parameter mode> is DEFOUT, then the parameter is a deferred output parameter. The value of a deferred output argument for a CLI routine R is not established by the execution of R but subsequently by the execution of a related CLI routine.
  - e) If <CLI parameter mode> is DEF, then the parameter is a deferred parameter. The value of a deferred argument for a CLI routine R is not established by the execution of R but subsequently by the execution of a related CLI routine.

- The value of an output, deferred output, deferred input, or deferred parameter is an address. It is either a non-pointer host variable passed by reference or a pointer host variable passed by value.
- A by-value version of a CLI routine is a version that expects each of its non-character input parameters to be provided as actual values. A by-reference version of a CLI routine is a version that expects each of its input parameters to be provided as an address. By-value and by-reference versions of the CLI routines shall be supported according to Table 3, "Supported calling conventions of SQL/CLI routines by language", for each of the languages identified in the first column of that table.

[09] 14 Table 3 — Supported calling conventions of SQL/CLI routines by language

Language	By-value	By-reference
Ada ([ISO8652])	Optional	Required
C ([ISO9899])	Required	Optional
COBOL ([ISO1989])	Optional	Required
Fortran ([ISO1539-1] and [ISO1539-2])	Not supported	Required
M ([ISO11756])	Optional	Required
Pascal ([ISO7185] and [ISO10206])	Optional **	Required
PL/I ([ISO6160])	Optional	Required

- 9) If a <CLI routine> is a by-reference routine, then its <CLI routine name> shall contain a <CLI by-reference prefix>. Otherwise, its <CLI routine name> shall contain a <CLI by-value prefix>.
- 10) The <implementation-defined CLI generic name> for an implementation-defined CLI function shall be different from the <CLI generic name> of any other CLI function. The <implementation-defined CLI generic name> for an implementation-defined CLI procedure shall be different from the <CLI generic name> of any other CLI procedure.
- 11) Any <CLI routine name> that cannot be used by an implementation because of its length or because it is made identical to some other <CLI routine name> by truncation is effectively replaced with an abbreviated name according to the following rules:
  - Any CLI by-value prefix> remains unchanged.
  - Any <CLI by-reference prefix> is replaced by SQR.
  - The <CLI generic name> is replaced by an abbreviated version according to Table 4, "Abbreviated SQL/CLI generic names".

Implementation-defined CLI routine	Implementation-defined abbreviation

- 12) Let CR be a <CLI routine> and let RN be its <CLI routine name>. Let RNU be the value of UPPER(RN). Case:
  - a) If HL supports case sensitive routine names, then the name used for the invocation of CR shall be RN.
  - b) If HL does not support <simple Latin lower case letter>s, then the name used for the invocation of CR shall be RNU.
  - If HL does not support case sensitive routine names, then the name used for the invocation of CR shall be *RN* or *RNU*.
- 13) Let operative data type correspondence table be the data type correspondence table for HL as specified in Subclause 5.20, "SQL/CLI data type correspondences". Refer to the two columns of the operative data type correspondence table as the "SQL data type column" and the "host data type column".
- 14) Let TI, TS, TC, and TV be the types listed in the host data type column for the rows that contains INTEGER, SMALLINT, CHARACTER (L) and CHARACTER VARYING (L), respectively, in the SQL data type column.
  - a) If TS is "None", then let TS = TI.
  - b) If TC is "None", then let TC = TV.
  - c) For each parameter P,

#### ISO/IEC 9075-3:2016(E) 5.1 <CLI routine>

Case:

- i) If the CLI parameter data type is INTEGER, then the type of the corresponding argument shall be TI.
- ii) If the CLI parameter data type is SMALLINT, then the type of the corresponding argument
- iii) If the CLI parameter data type is CHARACTER(L), then the type of the corresponding argument shall be  $T\bar{C}$ .
- iv) If the CLI parameter data type is ANY, then

Case:

- 1) If HL is C, then the type of the corresponding argument shall be "void"
- 2) Otherwise, the type of the corresponding argument shall be any type (other than "None") listed in the host data type column.
- d) If the CLI routine is a CLI function, then the type of the returned value is TS.

# **Access Rules**

None.

#### **General Rules**

1) The rules for invocation of a <CLI routine> are specified in Subclause 5.2, "<CLI routine> invocation".

# **Conformance Rules**

- 1) Without Feature C001, "CLI routine invocation in Ada", a conforming SQL/CLI application shall not contain an invocation of a Cli routine> written in Ada.
- 2) Without Feature C002, "CLI routine invocation in C", a conforming SQL/CLI application shall not contain an invocation of a **CD** routine> written in C.
- 3) Without Feature C003, "CLI routine invocation in COBOL", a conforming SQL/CLI application shall not contain an invocation of a <CLI routine> written in COBOL.
- 4) Without Feature C004, "CLI routine invocation in Fortran", a conforming SQL/CLI application shall not contain an invocation of a <CLI routine> written in Fortran.
- 5) Without Feature C005, "CLI routine invocation in MUMPS", a conforming SQL/CLI application shall not contain an invocation of a <CLI routine> written in M.
- 6) Without Feature C006, "CLI routine invocation in Pascal", a conforming SQL/CLI application shall not contain an invocation of a <CLI routine> written in Pascal.
- 7) Without Feature C007, "CLI routine invocation in PL/I", a conforming SQL/CLI application shall not contain an invocation of a <CLI routine> written in PL/I.

#### 5.2 <CLI routine> invocation

## **Function**

Specify the rules for invocation of a <CLI routine>.

# Syntax Rules

- 1) Let *HL* be the programming language of the invoking host program.
- A CLI function or CLI procedure is invoked by the *HL* mechanism for invoking functions or procedures, respectively.
- Let RNM be the <CLI routine name> of the <CLI routine> invoked by the host program and let RN be the SQL/CLI routine identified by RNM. The number of arguments provided in the invocation shall be the same as the number of <CLI parameter declaration>s for RN.
- Let DA be the data type of the i-th argument in the invocation and let DP be the <CLI parameter data type> of the i-th <CLI parameter declaration> of RN. DA shall be the HL equivalent of DP as specified by the rules of Subclause 5.1, "<CLI routine>".

- If the value of any input argument provided by the host program is not a value of the data type of the parameter, or if the value of any output argument resulting from the execution of the <CLI routine> is not a value supported by the SQL/CLI application for that parameter, then the effect is implementation-defined.
- Let GRN be the <CLI generic name> of RN.
- When the <CLI routine> is called by the SQL/CLI application:
  - The values of all input arguments to RN are established.
  - Case: b)
    - i) If RN is a CH routine with a statement handle as an input parameter, RN has no accompanying handle type parameter, and *GRN* is not Error, then:
      - 1) If the statement handle does not identify an allocated SQL-statement, then an exception condition is raised: *CLI-specific condition* — *invalid handle*. Otherwise, let *S* be the allocated SQL-statement identified by the statement handle.
      - If GRN is not Cancel, then the diagnostics area associated with S is emptied.
      - Let C be the allocated SQL-connection with which S is associated.
      - If there is no established SQL-connection associated with C, then an exception condition is raised: connection exception — connection does not exist. Otherwise, let EC be the established SOL-connection associated with C.
      - If EC is not the current SQL-connection, then the General Rules of Subclause 5.3, "Implicit set connection", are applied with EC as dormant SOL-connection.

#### ISO/IEC 9075-3:2016(E)

#### 5.2 <CLI routine> invocation

- If GRN is neither Cancel nor ParamData nor PutData and there is a deferred parameter number associated with S, then an exception condition is raised: CLI-specific condition function sequence error.
- 7) *RN* is invoked.
- ii) If RN is a CLI routine with a descriptor handle as an input parameter and RN has no accompanying handle type parameter and *GRN* is not CopyDesc, then:
  - If the descriptor handle does not identify an allocated CLI descriptor area, then an exception condition is raised: CLI-specific condition — invalid handle. Otherwise, let D be the allocated CLI descriptor area identified by the descriptor handle.
  - The diagnostics area associated with *D* is emptied.
  - 3) Let C be the allocated SQL-connection with which D is associated
  - 4) If there is no established SQL-connection associated with C then an exception condition is raised: connection exception — connection does not exist. Otherwise, let EC be the established SQL-connection associated with C.
  - 5) If EC is not the current SQL-connection, then the General Rules of Subclause 5.3, "Implicit set connection", are applied with EC as dormant SQL-connection.
  - 6) RN is invoked.
- Otherwise, RN is invoked. iii)
- 4) Case:
  - If RN is a CLI function, then:
    - The values of all output arguments are established. i)
    - Let RC be the return value
  - If RN is a CLI procedure, then:
    - The values of all output arguments are established except for the argument associated with the i) ReturnCode parameter.
    - ii) Let *RC* be the argument associated with the ReturnCode parameter.
- Case: 5)
  - If RN did not complete execution because it requires more input data, then:
    - *RC* is set to indicate **Data needed**.
    - An exception condition is raised: CLI-specific condition dynamic parameter value needed.
  - If RN executed successfully, then:
    - Either a completion condition is raised: successful completion, or a completion condition is i) raised: warning, or a completion condition is raised: no data.
    - ii) Case:
      - 1) If a completion condition is raised: *successful completion*, then *RC* is set to indicate **Success**.

- 2) If a completion condition is raised: warning, then RC is set to indicate Success with information.
- If a completion condition is raised: *no data*, then *RC* is set to indicate **No data found**.
- If RN did not execute successfully, then:
  - All changes made to SQL-data or schemas by the execution of RN are canceled. i)
  - One or more exception conditions are raised as determined by the General Rules of this and ii) other Subclauses of this part of ISO/IEC 9075 or by implementation-defined rules
  - iii) Case:
    - 1) If an exception condition is raised: *CLI-specific condition invalid handle*, then *RC* is set to indicate Invalid handle.
    - 2) Otherwise, *RC* is set to indicate **Error**.

- a) If GRN is neither Error nor GetDiagField nor GetDiagRec, and RC indicates neither Invalid handle ang 1 ause 4.2, ause 4.2, click to view the full state of the state of nor **Data needed**, then diagnostic information resulting from the execution of RN is placed into the appropriate diagnostics area as specified in Subclause 4.2. Return codes", and Subclause 4.3,
- b) Otherwise, no diagnostics area is updated.

# 5.3 Implicit set connection

## **Function**

Specify the rules for an implicit SET CONNECTION statement.

- 1) Let DC be the dormant SQL-connection specified in an application of this Subclause.
- 2) If an SQL-transaction is active for the current SQL-connection and the SQL-implementation does not support transactions that affect more than one SQL-server, then an exception condition is raised: *feature not supported multiple server transactions*.
- 3) If DC cannot be selected, then an exception condition is raised: connection exception connection failure.
- 4) The current SQL-connection *CC* and current SQL-session become a dormant SQL-connection and a dormant SQL-session, respectively. The SQL-session context for *CC* is preserved and is not affected in any way by operations performed over the selected SQL-connection.
  - NOTE 7 The SQL-session context is defined in Subclause 4.43, "SQL-sessions", in [ISO9075-2].
- 5) *DC* becomes the current SQL-connection and the SQL-session associated with *DC* becomes the *current SQL-session*. The SQL-session context is restored to the same state as at the time *DC* became dormant.
  - NOTE 8 The SQL-session context information is defined in Subclause 4.43, "SQL-sessions", in [ISO9075-2].
- 6) The SQL-server for the subsequent execution of SQL-statements via CLI routine invocations is set to that of the current SQL-connection.

#### 5.4 **Preparing a statement**

## **Function**

Prepare a statement.

## **General Rules**

- Let S, TL, ST, and INV be the ALLOCATED STATEMENT, TEXT LENGTH, STATEMENT INVOKER, respectively, in an application of this Subclause.
- If an open CLI cursor is associated with S, then an exception condition is raised: in all discrete cursor state.
- 3) Case:
  - a) If TL is not negative, then let L be TL.
  - b) If TL indicates NULL TERMINATED, then let L be the number of octets of ST that precede the implementation-defined null character that terminates a C character string.
  - c) Otherwise, an exception condition is raised: CLI-specific@ondition invalid string length or buffer length.
- 4) Case:
  - a) If L is zero, then an exception condition is raised: CLI-specific condition invalid string length or buffer length.
  - Otherwise, let P be the first L octets of ST
- 5) If P is a preparable dynamic delete statement: positioned> or a preparable dynamic update statement: positioned>, then let CN be the cursor name referenced by P. Let C be the allocated SQL-connection with which S is associated. If CN is not the name of a CLI cursor associated with another allocated SQL-statement associated with C, then an exception condition is raised: invalid cursor name.
- If one or more of the following are true, then an exception condition is raised: syntax error or access rule violation.
  - is a <start transaction statement>, a <commit statement>, a <rollback statement>, or a <release savepoint statement>.

NOTE 9 — See Table 37, "SQL-statement codes", in [ISO9075-2] for the list of preparable statement>s. Other parts of ISO/IEC 9075 may have corresponding tables that define additional codes representing statements defined by those parts of ISO/IEC 9075.

- P contains a <simple comment>.
- c) P contains a <dynamic parameter specification> whose data type is undefined as determined by the rules specified in Subclause 20.7, "repare statement>", in [ISO9075-2].
- 7) The data type of any <dynamic parameter specification> contained in P is determined by the rules specified in Subclause 20.7, "cprepare statement>", in [ISO9075-2].
- 8) Let *DTGN* be the default transform group name and *TFL* be the list of user-defined type name—transform group name pairs used to identify the group of transform functions for every user-defined type that is ref-

#### ISO/IEC 9075-3:2016(E)

#### 5.4 Preparing a statement

erenced in *P. DTGN* and *TFL* are not affected by the execution of a <set transform group statement> after *P* is prepared.

- 9) The following objects associated with *S* are destroyed:
  - a) Every prepared statement.
  - b) The cursor declaration descriptor every cursor instance descriptor of any CLI cursor.
  - c) Every select source.
  - d) If INV is "Prepare", then every executed statement.

If a cursor associated with S is destroyed, then so are any prepared statements that reference that cursor.

- 10) P is prepared.
- 11) If *INV* is "Prepare", then the prepared statement is associated with *S*.
- 12) If *P* is a <dynamic select statement> or a <dynamic single row select statement>, then *P* becomes the select source associated with *S*.
- 13) The General Rules of Subclause 5.9, "Implicit DESCRIBE USING clause", are applied with SS and S as SOURCE and ALLOCATED STATEMENT, respectively.
- 14) The validity of a prepared statement in an SQL-transaction different from the one in which the statement was prepared is implementation-defined.

#### 5.5 **Executing a statement**

# **Function**

Execute a statement.

#### **General Rules**

- 1) Let S, P, and INV be the ALLOCATED STATEMENT, the PREPARED STATEMENT, and the INVOKER, respectively, in an application of this Subclause.
- 2) P is executed as follows:

Case:

- a) If P is a <dynamic select statement> or a <dynamic single row select statement>, then the General Rules of Subclause 5.6, "Implicit CLI prepared cursor", are applied to P as SELECT SOURCE, S as ALLOCATED STATEMENT, and INV as INVOKER, respectively.
- b) Otherwise:
  - If INV is not "ParamData", then the General Rules of Subclause 5.10, "Implicit EXECUTE i) USING and OPEN USING clauses", are applied with EXECUTE as TYPE, P as SOURCE, and S as ALLOCATED STATEMENT.

NOTE 10 — When this Subclause is invoked from ParamData, Subclause 5.10, "Implicit EXECUTE USING and OPEN USING clauses", must have been previously invoked.

- ii) Case:
  - 1) If *P* is a preparable dynamic delete statement: positioned>, then:
    - A) Let CR be the cursor referenced by P and let SCR be the allocated SQL-statement associated with CR.
    - B) Let TT be the implicit or explicit <target table> of P, as defined by the Syntax Rules for preparable dynamic delete statement: positioned>.
    - C) The General Rules of Subclause 15.5, "Effect of a positioned delete", in ISO/IEC 9075-2, are applied with CR as CURSOR, P as STATEMENT, and TT as TARGET. For the purposes of the application of these Rules, the row in CR identified by SCR's CURRENT OF POSITION statement attribute is the *current row* of *CR*.
    - D) If the execution of P deleted the current row of CR, then the effect on the fetched row, if any, associated with SCR is implementation-defined.
  - If *P* is a preparable dynamic update statement: positioned>, then:
    - A) Let CR be the cursor referenced by P and let SCR be the allocated SQL-statement associated with CR.
    - B) Let SCL be the <set clause list> contained in P.
    - C) Let TT be the implicit or explicit <target table> of P, as defined by the Syntax Rules for preparable dynamic update statement: positioned>.

## ISO/IEC 9075-3:2016(E) 5.5 Executing a statement

- D) The General Rules of Subclause 15.6, "Effect of a positioned update", in ISO/IEC 9075-2, are applied with *CR* as *CURSOR*, *SCL* as *SET CLAUSE LIST*, *P* as *STATE-MENT*, and *TT* as *TARGET*. For the purposes of the application of these Rules, the row in *CR* identified by *SCR*'s CURRENT OF POSITION statement attribute is the *current row* of *CR*.
- E) If the execution of *P* updated the current row of *CR*, then the effect on the fetched row, if any, associated with *SCR* is implementation-defined.
- 3) Otherwise, the results of the execution are the same as if the statement were contained in an <externally-invoked procedure> and executed; these are described in Subclause 13.3, "<externally-invoked procedure>", in [ISO9075-2].
- iii) If *P* is a <call statement>, then
  - 1) The General Rules of Subclause 5.11, "Implicit CALL USING clause", are applied to *P* as *SOURCE* and *S* as *ALLOCATED STATEMENT*.
  - 2) If the result set sequence *RSS* of the SQL-invoked procedure that was invoked by the <call statement> is non-empty, then the General Rules of Subclause 5.7, "Implicit CLI procedural result cursor", are applied, with *S* as *ALLOCATED STATEMENT* and *RSS* as *RESULT SET SEQUENCE*.
- 3) Let R be the value of the ROW\_COUNT field from the diagnostics area associated with S.
- 4) R becomes the row count associated with S.
- 5) If *P* executed successfully, then any executed statement associated with *S* is destroyed and *P* becomes the executed statement associated with *S*.

#### 5.6 Implicit CLI prepared cursor

## **Function**

Specify the cursor declaration descriptor and cursor instance descriptor of a CLI prepared cursor.

# **General Rules**

- Let SS, AS, and INV be respectively a SELECT SOURCE, ALLOCATED STATEMENT, and INV specified in an application of this Subclause.
- If there is no CLI cursor associated with AS, then the General Rules of Subclause 5.8 are applied, with AS as ALLOCATED STATEMENT.
- Let CID be the cursor instance descriptor of the cursor associated with AS, and let CDD be the cursor declaration descriptor of CID.
- The kind of cursor in *CID* is set to CLI prepared cursor.
- The declared properties of the cursor declaration descriptor of *CID* are set as follows:
  - The cursor's declared sensitivity is

Case:

- If the value of the CURSOR SENSITIVITY attribute of AS is INSENSITIVE, then INSENSIi) TIVE.
- If the value of the CURSOR SENSITIVITY attribute of AS is SENSITIVE, then SENSITIVE. ii)
- Otherwise, ASENSIT
- The cursor's declared scrollability is

Case:

- If the value of the CURSOR SCROLLABLE attribute of AS is SCROLLABLE, then SCROLL. i)
- Otherwise, NO SCROLL. ii)
- The cursor's declared holdability is

- If the value of the CURSOR HOLDABLE attribute of AS is HOLDABLE, then WITH HOLD.
- Otherwise, WITHOUT HOLD.
- The cursor's declared returnability is implementation-defined.
- If INV is not "ParamData", then the General Rules of Subclause 5.10, "Implicit EXECUTE USING and OPEN USING clauses", are applied with OPEN as TYPE, SS as SOURCE, and AS as ALLOCATED STATEMENT.

NOTE 11 — When this Subclause is invoked from ParamData, Subclause 5.10, "Implicit EXECUTE USING and OPEN USING clauses", must have been previously invoked.

#### ISO/IEC 9075-3:2016(E) 5.6 Implicit CLI prepared cursor

The General Rules of Subclause 7.1, "Effect of opening a cursor", are applied with CID as CURSOR.

NOTE 12 — In applying this Subclause, the values of <dynamic parameter specification>s are described by the implementation parameter descriptor and application parameter descriptor of AS, as explained in Subclause 5.10, "Implicit EXECUTE USING and OPEN USING clauses".

STANDARDS SO. COM. Click to view the full poor of 150 life of 250 life of 150 life of 150

#### Implicit CLI procedural result cursor 5.7

# **Function**

Specify the cursor declaration descriptor and cursor instance descriptor of a CLI procedural result cursor.

- 1) Let AS be the ALLOCATED STATEMENT and let RSS be the RESULT SET SEQUENCE specified in an application of this Subclause.
- If there is no CLI cursor associated with AS, then the General Rules of Subclause 5.8 are applied, with AS as ALLOCATED STATEMENT.
- 3) Let CID be the cursor instance descriptor of the cursor associated with AS and let CDD be the cursor declaration descriptor of CID.
- The kind of cursor in CID is set to CLI procedural result cursor.
- 5) If RSS is not empty, then the General Rules of Subclause 15.2, "Effect of receiving a result set", in [ISO9075-2] are applied, with CID as CURSOR and RSS as RESULT SET SEQUENCE.
- 6) Let CS be the <cursor specification> in the result set descriptor of CID.
- The General Rules of Subclause 5.9, "Implicit DESCRIBE USING clause", are applied with CS as SOURCE and AS as ALLOCATED STATEMENT.

#### 5.8 **Initial CLI cursor**

# **Function**

Create the initial cursor declaration descriptor and cursor instance descriptor of a CLI cursor.

- The cursor's origin is AS.

  The cursor's declared properties are undefined.

  The cursor declared properties are undefined. 1) Let AS be the ALLOCATED STATEMENT in an application of this Subclause.
- 2) A cursor declaration descriptor *CDD* is created as follows:
- 3) A cursor instance descriptor CID is created, as follows:

  - The SQL-session identifier is the SQL-session identifier of AS.
  - The cursor's state is closed.
- CID is the CLI cursor associated with As

#### 5.9 **Implicit DESCRIBE USING clause**

This Subclause is modified by Subclause 19.2, "Implicit DESCRIBE USING clause", in ISO/IEC 9075-9.

# **Function**

Specify the rules for an implicit DESCRIBE USING clause.

## **General Rules**

- 1) Let S and AS be a SOURCE and an ALLOCATED STATEMENT specified in the rules of this Subclause.
- 2) Let IRD and IPD be the implementation row descriptor and implementation parameter descriptor, respectively, associated with AS.
- 3) Let *HL* be the programming language of the invoking host program.
- The value of DYNAMIC\_FUNCTION and DYNAMIC\_FUNCTION CODE in IRD and IPD are respectively a character string representation of the prepared statement and a numeric code that identifies the type of the prepared statement.
- 5) A representation of the column descriptors of the <select list columns for the prepared statement is stored in IRD as follows:
  - Case:
    - If there is a select source associated with AS, then: i)
      - 1) Let TBL be the table defined by S and let D be the degree of TBL.

- A) If the value of the statement attribute NEST DESCRIPTOR is <u>True</u>, then let NS<sub>i</sub>, 1 (one)  $\leq$   $i \leq D$ , be the number of subordinate descriptors of the descriptor for the *i*-th column of T.
- B) Otherwise, let  $NS_i$ , 1 (one)  $\leq i \leq D$ , be 0 (zero).
- TOP LEVEL COUNT is set to D. If D is 0 (zero), then let TD be 0 (zero); otherwise, let TD be  $D + \sum_{i=1}^{D} (NS_i)$ . COUNT is set to TD.
- Let *SL* be the collection of <select list> columns of *TBL*.
- Case:
  - A) If some subset of SL is the primary key of TBL, then KEY\_TYPE is set to 1 (one).
  - B) If some subset of *SL* is the preferred key of *TBL*, then KEY\_TYPE is set to 2.
  - C) Otherwise, KEY TYPE is set to 0 (zero).
- Otherwise: ii)
  - 1) Let D be 0 (zero). Let TD be 0 (zero).

# ISO/IEC 9075-3:2016(E)

#### 5.9 Implicit DESCRIBE USING clause

- 2) KEY\_TYPE is set to 0 (zero).
- b) If TD is zero, then no item descriptor areas are set. Otherwise, the first TD item descriptor areas are set so that the i-th item descriptor area contains the descriptor of the i-th column of TBL such that:
  - i) The descriptor for the first such column is assigned to the first descriptor area.
  - ii) The descriptor for the j+1-th column is assigned to the  $i+NS_i+1$ -th item descriptor area.
  - If the value of the statement attribute NEST DESCRIPTOR is <u>True</u>, then the implicitly ordered iii) subordinate descriptors for the j-th column are assigned to contiguous item descriptor areas starting at the i+1-th item descriptor area.
- The descriptor of a column consists of values for LEVEL, TYPE, NULLABLE, NAME, UNNAMED, KEY\_MEMBER, and other fields depending on the value of TYPE as described below. Those fields and fields that are not applicable for a particular value of TYPE are set to implementation-dependent values. The DATA POINTER, INDICATOR POINTER, and OCTET LENGTH POINTER fields are not relevant in this case.
  - i) If the item descriptor area is set to a descriptor that is immediately subordinate to another whose LEVEL value is some value k, then LEVEL is set to k+1 otherwise, LEVEL is set to 0 (zero).
  - ii) TYPE is set to a code as shown in Table 7, "Codes used for implementation data types in SQL/CLI", indicating the data type of the column or subordinate descriptor.
  - iii) Case:
    - 1) If the value of LEVEL is 0 (zero), then:
      - A) If the resulting column is possibly nullable, then NULLABLE is set to 1 (one); otherwise NULLABLE is set to 0 (zero).
      - B) If the column name is implementation-dependent, then NAME is set to the implementation-dependent name of the column and UNNAMED is set to 1 (one); otherwise, NAME is set to the <derived column> name for the column and UNNAMED is set to 0 (zero).
      - C) Case:
        - If a <select list> column C is a member of a primary or preferred key of TBL, then KEY\_MEMBER is set to 1 (one).
        - Otherwise, KEY MEMBER is set to 0 (zero).

Otherwise:

- A) NULLABLE is set to 1 (one).
- B) Case:
  - I) If the item descriptor area describes a field of a row type, then

Case:

1) If the name of the field is implementation-dependent, then NAME is set to the implementation-dependent name of the field and UNNAMED is set to 1 (one).

- 2) Otherwise, NAME is set to the name of the field and UNNAMED is set to 0 (zero).
- II) Otherwise, UNNAMED is set to 1 (one) and NAME is set to an implementationdependent value.
- C) KEY MEMBER is set to 0 (zero).

#### iv) Case:

- 1) If TYPE indicates a <character string type>, then LENGTH is set to the length or maximum length in characters of the character string. OCTET LENGTH is set to the maximum possible length in octets of the character string. If HL is C, then the length's specified in LENGTH and OCTET LENGTH do not include the implementation-defined null character that terminates a C character string. CHARACTER\_SET\_CATALOG, CHARAC-TER\_SET\_SCHEMA, and CHARACTER\_SET\_NAME are set to the <character set name> of the character string's character set. COLLATION\_CATALOG COLLATION\_SCHEMA, and COLLATION NAME are set to the <collation name > of the character string's collation.
- If TYPE indicates a <binary string type>, then LENGTH and OCTET LENGTH are both set to the length or maximum length in octets of the binary string.
- If TYPE indicates an <exact numeric type>, then PRECISION and SCALE are set to the precision and scale of the exact numeric.
- 4) If TYPE indicates an <approximate numeric type>, then PRECISION is set to the precision of the approximate numeric.
- If TYPE indicates a <datetime type>, then LENGTH is set to the length in positions of the datetime type, DATETIME INTERVAL CODE is set to a code as specified in Table 9, "Codes associated with date me data types in SQL/CLI", to indicate the specific datetime data type, and PRECISION is set to the <time precision> or <timestamp precision> as applicable.
- If TYPE indicates INTERVAL, then LENGTH is set to the length in positions of the interval type, DATETIME INTERVAL CODE is set to a code as specified in Table 10, "Codes associated with <interval qualifier> in SQL/CLI", to indicate the specific <interval qualifier, DATETIME INTERVAL PRECISION is set to the <interval leading field precision>, and PRECISION is set to the <interval fractional seconds precision>, if applicable.
  - If TYPE indicates REF, then LENGTH and OCTET LENGTH are set to the length in octets of the reference type, USER DEFINED TYPE CATALOG. USER\_DEFINED\_TYPE\_SCHEMA, and USER\_DEFINED\_TYPE\_NAME are set to the <user-defined type name> of the <reference type>, and SCOPE\_CATALOG, SCOPE\_SCHEMA, and SCOPE\_NAME are set to the qualified name of the referenceable base table.
- 8) If TYPE indicates USER-DEFINED TYPE, then USER\_DEFINED\_TYPE\_CATALOG, USER DEFINED TYPE SCHEMA, and USER DEFINED TYPE NAME are set to the <user-defined type name> of the user-defined type. SPECIFIC TYPE CATALOG, SPECIFIC TYPE SCHEMA, and SPECIFIC TYPE NAME are set to the <user-defined type name> of the user-defined type and CURRENT TRANSFORM GROUP is set to the CURRENT\_TRANSFORM\_GROUP\_FOR\_TYPE for the user-defined type.

#### ISO/IEC 9075-3:2016(E) 5.9 Implicit DESCRIBE USING clause

USER\_DEFINED\_TYPE\_CODE is set to a code as specified in Table 12, "Codes associated with user-defined types in SQL/CLI", to indicate the category of the user-defined type.

- 9) If TYPE indicates ROW, then DEGREE is set to the degree of the row type.
- 10) of TYPE indicates ARRAY, then CARDINALITY is set to the maximum cardinality of the array type.
- 6) Let C be the allocated SQL-connection with which AS is associated.
- 7) If POPULATE IPD for C is <u>False</u>, then no further rules of this Subclause are applied.
- 8) If POPULATE IPD for *C* is <u>True</u>, then a descriptor for the <dynamic parameter specification>s for the prepared statement is stored in *IPD* as follows:
  - a) Let D be the number of <dynamic parameter specification>s in S.

Case:

- i) If the value of the statement attribute NEST DESCRIPTOR is  $\underline{True}$ , then let  $NS_i$ , 1 (one)  $\leq i \leq D$ , be the number of subordinate descriptors of the descriptor for the i-th input dynamic parameter.
- ii) Otherwise, let  $NS_i$ , 1 (one)  $\leq i \leq D$ , be 0 (zero).
- b) TOP\_LEVEL\_COUNT is set to D. If D is 0 (zero), then let TD be 0 (zero); otherwise, let TD be  $D + \sum_{i=1}^{D} (NS_i)$ . COUNT is set to TD.

NOTE 13 — The KEY\_TYPE field is not relevant in this case.

- c) If *TD* is zero, then no item descriptor areas are set. Otherwise, the first *TD* item descriptor areas are set so that the *i*-th item descriptor area contains a descriptor of the *j*-th <dynamic parameter specification> such that:
  - i) The descriptor for the first such <dynamic parameter specification> is assigned to the first descriptor area.
  - ii) The descriptor for the j+1-th <dynamic parameter specification> is assigned to the  $i+NS_j+1$ -th item descriptor area.
  - iii) If the value of the statement attribute NEST DESCRIPTOR is  $\underline{True}$ , then the implicitly ordered subordinate descriptors for the j-th <dynamic parameter specification> are assigned to contiguous item descriptor areas starting at the i+1-th item descriptor area.
- d) The descriptor of a <dynamic parameter specification> consists of values for LEVEL, TYPE, NUL-LABLE, NAME, UNNAMED, PARAMETER\_MODE, PARAMETER\_ORDINAL\_POSITION, PARAMETER\_SPECIFIC\_CATALOG, PARAMETER\_SPECIFIC\_SCHEMA, PARAMETER\_SPECIFIC\_NAME, and other fields depending on the value of TYPE as described below. Those fields and fields that are not applicable for a particular value of TYPE are set to implementation-dependent values. The DATA\_POINTER, INDICATOR\_POINTER, OCTET\_LENGTH\_POINTER, RETURNED CARDINALITY POINTER, and KEY MEMBER fields are not relevant in this case.
  - i) If the item descriptor area is set to a descriptor that is immediately subordinate to another whose LEVEL value is some value k, then LEVEL is set to k+1; otherwise, LEVEL is set to 0 (zero).

- TYPE is set to a code as shown in Table 7, "Codes used for implementation data types in ii) SQL/CLI', indicating the data type of the <dynamic parameter specification> or subordinate descriptor.
- iii) NULLABLE is set to 1 (one).
  - NOTE 14 This indicates that the <dynamic parameter specification> can have the null value.
- KEY\_MEMBER is set to 0 (zero). iv)
- UNNAMED is set to 1 (one) and NAME is set to an implementation-dependent value v)
- vi) Case:
  - 1) If TYPE indicates a <character string type>, then LENGTH is set to the length or maximum length in characters of the character string. OCTET LENGTH is set to the maximum possible length in octets of the character string. If HL is C, then the lengths specified in LENGTH and OCTET LENGTH do not include the implementation-defined null character that terminates a C character string. CHARACTER\_SET\_CATALOG, CHARAC-TER\_SET\_SCHEMA, and CHARACTER\_SET\_NAME are set to the <character set name> of the character string's character set. COLLATION\_CATALOG, COLLATION\_SCHEMA, and COLLATION NAME are set to the <collation name > of the character string's collation.
  - If TYPE indicates a <binary string type>, then LENGTH and OCTET\_LENGTH are both set to the length or maximum length in octets of the binary string.
  - If TYPE indicates an <exact numeric type>, then PRECISION and SCALE are set to the precision and scale of the exact numeric.
  - If TYPE indicates an <approximate numeric type>, then PRECISION is set to the precision of the approximate numeric.
  - If TYPE indicates a <datetime type>, then LENGTH is set to the length in positions of the datetime type, DATETIME\_INTERVAL\_CODE is set to a code as specified in Table 9, "Codes associated with datetime data types in SQL/CLI", to indicate the specific datetime data type, and PRECISION is set to the <time precision> or <timestamp precision> as applicable.
  - 6) If TYPE indicates INTERVAL, then LENGTH is set to the length in positions of the interval type, DATETIME INTERVAL CODE is set to a code as specified in Table 10, "Codes associated with <interval qualifier> in SQL/CLI", to indicate the specific <interval qualifier>, DATETIME INTERVAL PRECISION is set to the <interval leading field precision>, and PRECISION is set to the <interval fractional seconds precision>, if applicable.
  - If TYPE indicates REF, then LENGTH and OCTET\_LENGTH are set to the length in octets of the reference type, USER\_DEFINED\_TYPE\_CATALOG, USER DEFINED TYPE SCHEMA, and USER DEFINED TYPE NAME are set to the <user-defined type name> of the <reference type>, and SCOPE\_CATALOG, SCOPE SCHEMA, and SCOPE NAME are set to the qualified name of the referenceable base table.
  - If TYPE indicates USER-DEFINED TYPE, then USER\_DEFINED\_TYPE\_CATALOG, USER DEFINED TYPE SCHEMA, and USER DEFINED TYPE NAME are set to the <user-defined type name> of the user-defined type. SPECIFIC\_TYPE\_CATALOG, SPECIFIC TYPE SCHEMA, and SPECIFIC TYPE NAME are set to the <user-defined

# ISO/IEC 9075-3:2016(E)

#### 5.9 Implicit DESCRIBE USING clause

type name> of the user-defined type and CURRENT\_TRANSFORM\_GROUP is set to the CURRENT\_TRANSFORM\_GROUP\_FOR\_TYPE <user-defined type name>.

- 9) If TYPE indicates ROW, then DEGREE is set to the degree of the row type.
- 10) of TYPE indicates ARRAY, then CARDINALITY is set to the maximum cardinality of the array type.
- 9) If LEVEL is 0 (zero) and the prepared statement being described is a <call statement>, then:
  - a) Let SR be the subject routine for the <routine invocation> of the <call statement>.
  - b) Let  $D_x$  be the x-th <dynamic parameter specification> simply contained in an SQL argument  $A_y$  of the <call statement>.
  - c) Let  $P_v$  be the y-th SQL parameter of SR.

NOTE 15 — A *P* whose <parameter mode> is IN can be a <value expression> that contains zero, one, or more <dynamic parameter specification>s. Thus:

- Every  $D_x$  maps to one and only one  $P_y$ .
- Several  $D_x$  instances can map to the same  $P_y$ .
- There can be  $P_{v}$  instances that have no  $D_{x}$  instances that map to them.
- d) The PARAMETER\_MODE value in the descriptor for each  $D_x$  is set to the value from Table 11, "Codes associated with parameter mode> in SQL/CLI", that indicates the parameter mode> of  $P_v$ .
- e) The PARAMETER\_ORDINAL\_POSITION value in the descriptor for each  $D_x$  is set to the ordinal position of  $P_y$ .
- f) The PARAMETER\_SPECIFIC\_CATALOG, PARAMETER\_SPECIFIC\_SCHEMA, and PARAMETER\_SPECIFIC\_NAME values in the descriptor for each  $D_x$  is set to the values that identify the catalog, schema, and specific name of SR.

# 5.10 Implicit EXECUTE USING and OPEN USING clauses

# **Function**

Specify the rules for an implicit EXECUTE USING clause and an implicit OPEN USING clause.

- 1) Let T, S, and AS be the TYPE, SOURCE, and ALLOCATED STATEMENT, respectively, specified in the rules of this Subclause.
- 2) Let IPD, ARD, and APD be the current implementation parameter descriptor, current application row descriptor, and current application parameter descriptor, respectively, for AS.
- 3) Let C be the allocated SOL-connection with which S is associated.
- 4) IPD and APD describe the <dynamic parameter specification>s and <dynamic parameter specification> values, respectively, for the statement being executed. Let D be the number of <dynamic parameter specification>s in S. Let NAPD be the value of COUNT for APD and let NIPD be the value of COUNT for IPD.
  - a) If NAPD is less than zero, then an exception condition is raised: dynamic SQL error invalid descriptor count.
  - b) If NIPD is less than zero, then an exception condition is raised: dynamic SOL error invalid descriptor count.
  - c) If NIPD is less than D, then an exception condition is raised: dynamic SOL error using clause does not match dynamic parameter specifications.
  - d) Let NIDAL be the number of item descriptor areas in IPD for which LEVEL is 0 (zero). If NIDAL is greater than D, then it is implementation-defined whether an exception condition is raised: dynamic *SOL error* — using clause does not match dynamic parameter specifications.
  - e) If the first NIPD item descriptor areas of IPD are not valid as specified in Subclause 5.18, "Description of CLI item descriptor areas", then an exception condition is raised: dynamic SQL error—using clause does not match dynamic parameter specifications.
  - f) Let AD be the minimum of NAPD and NIPD.
  - g) For each of the first AD item descriptor areas of APD, if TYPE indicates DEFAULT, then:
    - Let TP, P, and SC be the values of the TYPE, PRECISION, and SCALE fields, respectively, for the corresponding item descriptor area of *IPD*.
    - The data type, precision, and scale of the described <dynamic parameter specification> value (or part thereof, if the item descriptor area is a subordinate descriptor) are set to TP, P, and SC, respectively, for the purposes of this invocation only.
  - h) If the first AD item descriptor areas of APD are not valid as specified in Subclause 5.18, "Description of CLI item descriptor areas", then an exception condition is raised: dynamic SQL error — using clause does not match dynamic parameter specifications.
  - For the first *AD* item descriptor areas in *APD*:

#### ISO/IEC 9075-3:2016(E) 5.10 Implicit EXECUTE USING and OPEN USING clauses

- i) If the number of item descriptor areas in which the value of LEVEL is 0 (zero) is not D, then an exception condition is raised: dynamic SQL error — using clause does not match dynamic parameter specifications.
- ii) If all of the following are true, then an exception condition is raised: dynamic SQL error using clause does not match dynamic parameter specifications.
  - 1) The value of the host variable addressed by INDICATOR POINTER is not negative.
  - At least one of the following is true:
    - A) TYPE does not indicate ROW and the item descriptor area is not subordinate to an item descriptor area for which the value of the host variable addressed by the INDI-CATOR POINTER is not negative.
    - B) TYPE indicates ARRAY or ARRAY LOCATOR.
    - C) TYPE indicates MULTISET or MULTISET LOCATOR
  - The value of the host variable addressed by DATA\_POINTER is not a valid value of the data type represented by the item descriptor area.
- For each of the first AD item descriptor areas ADIDA in APD:
  - If the OCTET\_LENGTH\_POINTER field of ANDA has the same non-zero value as the i) INDICATOR\_POINTER field of *IDA*, then *SHARE* is true for *ADIDA*; otherwise, *SHARE* is false for ADIDA.

- If SHARE is true for ADIDA and the value of the commonly addressed host variable is the appropriate 'Code' for SQLNULL DATA in Table 27, "Miscellaneous codes used in CLI", then *NULL* is true for *ADIDA*.
- If SHARE is false for ADIDA, INDICATOR POINTER is not zero, and the value of the host variable addressed by INDICATOR\_POINTER is the appropriate 'Code' for SQL NULL DATA in Table 27, "Miscellaneous codes used in CLI", then NULL is true for ADIDA. (
- Otherwise, *NULL* is false for *ADIDA*.
- If NULL is false for ADIDA, OCTET LENGTH POINTER is not 0 (zero), and the value of ii) the host variable addressed by OCTET\_LENGTH\_POINTER is the appropriate 'Code' for SQL NULL DATA in Table 27, "Miscellaneous codes used in CLI", then DEFERRED is true for ADIDA; otherwise, DEFERRED is false for ADIDA.
- k) If all of the following are true for any item descriptor area in the first AD item descriptor areas of APD, then an exception condition is raised: dynamic SQL error — using clause does not match dynamic parameter specifications.
  - DEFERRED is true for the item descriptor area. i)
  - Either of the following is true: ii)
    - The value of LEVEL is zero and TYPE indicates ROW, ARRAY, or MULTISET.
    - 2) LEVEL is greater than 0 (zero).

NOTE 16 — This rule states that a parameter whose type is ROW, ARRAY, or MULTISET shall be bound; it cannot be a deferred parameter.

- For each item descriptor area whose LEVEL is 0 (zero) and for each of its subordinate descriptor areas, if any, for which DEFERRED is false in the first AD item descriptor areas of APD and whose corresponding <dynamic parameter specification> has a <parameter mode> of PARAM MODE IN or PARAM MODE INOUT, refer to the corresponding <dynamic parameter specification> value as an immediate parameter value and refer to the corresponding <dynamic parameter specification> as an immediate parameter.
- m) Let IDA be the i-th item descriptor area of APD whose LEVEL value is 0 (zero). Let SD7 be the data type represented by IDA. The associated value of IDA, denoted by SV, is defined as follows.

#### Case:

- i) If *NULL* is true for *IDA*, then *SV* is the null value.
- If TYPE indicates ROW, then SV is a row whose type is SDT and whose field values are the ii) associated values of the immediately subordinate descriptor areas of *IDA*.
- iii) Otherwise:
  - 1) Let V be the value of the host variable addressed by DATA POINTER.
  - 2) Case:
    - A) If TYPE indicates CHARACTER, then

- If OCTET\_LENGTH\_POINTER is zero or if OCTET\_LENGTH\_POINTER I) is not zero and the value of the host variable addressed by OCTET\_LENGTH\_POINTER indicates NULL TERMINATED, then let L be the number of characters of V that precede the implementation-defined null character that terminates a C character string.
- II) Otherwise, let Q be the value of the host variable addressed by OCTET LENGTH POINTER and let L be the number of characters wholly contained in the first Q octets of V.
- Otherwise, let L be zero.
- 3) Let SV be V with effective data type SDT, as represented by the length value L and by the values of the TYPE, PRECISION, and SCALE fields.
- n) Let  $\overrightarrow{IDT}$  be the effective data type of the *i*-th immediate parameter as represented by the values of the TYPE, LENGTH, PRECISION, SCALE, DATETIME\_INTERVAL\_CODE, DATETIME\_INTER-VAL PRECISION, CHARACTER SET CATALOG, CHARACTER SET SCHEMA, CHARAC-TER\_SET\_NAME, USER\_DEFINED\_TYPE\_CATALOG, USER\_DEFINED\_TYPE\_SCHEMA, USER DEFINED TYPE NAME, SCOPE CATALOG, SCOPE SCHEMA, and SCOPE NAME fields in the i-th item descriptor area of IPD for which the LEVEL value is 0 (zero), and all its subordinate descriptor areas.
- o) Let SDT be the effective data type of the i-th bound parameter as represented by the values of the TYPE, LENGTH, PRECISION, SCALE, DATETIME\_INTERVAL\_CODE, DATETIME\_INTER-VAL\_PRECISION, CHARACTER\_SET\_CATALOG, CHARACTER\_SET\_SCHEMA, CHARAC-TER\_SET\_NAME, USER\_DEFINED\_TYPE\_CATALOG, USER\_DEFINED\_TYPE\_SCHEMA,

#### ISO/IEC 9075-3:2016(E)

#### 5.10 Implicit EXECUTE USING and OPEN USING clauses

USER\_DEFINED\_TYPE\_NAME, SCOPE\_CATALOG, SCOPE\_SCHEMA, and SCOPE\_NAME fields in the corresponding item descriptor area of APD for which the LEVEL is 0 (zero), and all its subordinate descriptor areas.

- Case:
  - i) If SDT is a locator type, then let TV be the value SV.
  - ii) If *SDT* and *TDT* are predefined types, then:
    - 1) Case:
      - A) If the <cast specification>

```
CAST ( SV AS TDT )
```

does not conform to the Syntax Rules of Subclause 6.13, "seast specification", in [ISO9075-2], and there is an implementation-defined conversion from type SDT to type TDT, then that implementation-defined conversion is effectively performed, converting SV to type TDT, and the result is the value TV of the i-th bound target.

- B) Otherwise:
  - I) If the <cast specification>

```
CAST ( SV AS TDT )
```

does not conform to the Syntax Rules of Subclause 6.13, "<cast specification>", in [ISO9075-2], then an exception condition is raised: dynamic SQL error restricted data type attribute violation.

II) The <cast specification>

is effectively performed and the result is the value TV of the i-th bound target.

2) Let *UDT* be the effective data type of the actual *i*-th immediate parameter, defined to be the data type represented by the values of the TYPE, LENGTH, PRECISION, SCALE, DATETIME INTERVAL CODE, DATETIME INTERVAL PRECISION, CHARAC-TER SET\_CATALOG, CHARACTER\_SET\_SCHEMA, CHARACTER\_SET\_NAME, USER DEFINED TYPE CATALOG, USER DEFINED TYPE SCHEMA, USER\_DEFINED\_TYPE\_NAME, SCOPE\_CATALOG, SCOPE\_SCHEMA, and SCOPE NAME fields that would automatically be set in the corresponding item descriptor area of IPD if POPULATE IPD was True for C.

- Case:
  - A) If the <cast specification>

```
CAST ( TV AS UDT )
```

does not conform to the Syntax Rules of Subclause 6.13, "<cast specification>", in [ISO9075-2], and there is an implementation-defined conversion from type SDT to type *UDT*, then that implementation-defined conversion is effectively performed, converting SV to type UDT and the result is the value TV of the i-th immediate parameter.

## B) Otherwise:

I) If the <cast specification>

```
CAST ( TV AS UDT )
```

does not conform to the Syntax Rules of Subclause 6.13, "<cast specification>", in [ISO9075-2], then an exception condition is raised: dynamic SQL error restricted data type attribute violation.

II) The <cast specification>

```
CAST ( TV AS UDT )
```

is effectively performed and the result is the value of the thin immediate parameter.

- If SDT is a predefined type and TDT is a user-defined type, then: iii)
  - 1) Let DT be the data type identified by TDT.
  - 2) If the current SQL-session has a group name corresponding to the user-defined name of DT, then let GN be that group name; otherwise, let GN be the default transform group name associated with the current SQL-session.
  - The Syntax Rules of Subclause 9.27, "Determination of a to-sql function", in [ISO9075-2], are applied with DT as TYPE and GN as GROUP.

Case:

A) If there is an applicable to sql function, then let TSF be that to-sql function. If TSF is an SQL-invoked method, then let TSFPT be the declared type of the second SQL parameter of TSF; otherwise, let TSFPT be the declared type of the first SQL parameter of TSF.

Case:

IF TSFPT is compatible with SDT, then

Case:

1) If TSF is an SQL-invoked method, then TSF is effectively invoked with the value returned by the function invocation:

DT()

as the first parameter and SV as the second parameter. The result of evaluating the expression TSF(DT(), SV) is the value of the *i*-th immediate parameter.

- 2) Otherwise, TSF is effectively invoked with SV as the first parameter. The result of evaluating the expression TSF(SV) is the value of the i-th immediate parameter.
- II) Otherwise, an exception condition is raised: dynamic SQL error — restricted data type attribute violation.

- ... one of the first AD item descriptor areas of APD, then:
  ... eter number associated with the first such item descriptor area.
  ... deferred parameter number associated with AS.
  ... XECUTE, then S becomes the statement source associated with AS.
  ... exception condition is raised: CLI-specific condition dynamic parameter raine needec

# 5.11 Implicit CALL USING clause

## **Function**

Specify the rules for an implicit CALL USING clause.

- 1) Let S and AS be a SOURCE and an ALLOCATED STATEMENT specified in the rules of this Subclause.
- 2) Let IPD and APD be the current implementation parameter descriptor and current application row descriptor, respectively, for AS.
- IPD and APD describe the <dynamic parameter specification>s and <dynamic parameter specification> values, respectively, for the <call statement> being executed. Let D be the pumber of <dynamic parameter specification>s in *S*.
  - Let AD be the value of the COUNT field of APD. If AD is less than zero, then an exception condition is raised: dynamic SQL error — invalid descriptor count.
  - For each item descriptor area in the APD whose LEVEL is 0 (zero) in the first AD item descriptor areas of APD, and for all of their subordinate descriptor areas, refer to a <dynamic parameter specification> value whose corresponding item descriptor areas have a non-zero DATA POINTER value and whose corresponding <dynamic parameter specification> has a <parameter mode> of PARAM MODE OUT or PARAM MODE INOUT as a bound target and refer to the corresponding <dynamic parameter specification> as a bound parameter.
  - c) If any item descriptor area corresponding to a bound target in the first AD item descriptor areas of APD is not valid as specified in Subclause 5.18, "Description of CLI item descriptor areas", then an exception condition is raised: dynamic SOL error — using clause does not match target specifications.
  - Let SDT be the effective data type of the i-th bound parameter as represented by the values of the TYPE, LENGTH, PRECISION, SCALE, DATETIME INTERVAL CODE, DATETIME INTER-VAL\_PRECISION, CHARACTER\_SET\_CATALOG, CHARACTER\_SET\_SCHEMA, CHARAC-TER SET NAME USER DEFINED TYPE CATALOG, USER DEFINED TYPE SCHEMA, USER\_DEFINED\_TYPE\_NAME, SCOPE\_CATALOG, SCOPE\_SCHEMA, and SCOPE\_NAME fields in the i-th tem descriptor area of IPD for which the LEVEL is 0 (zero) and all of its subordinate descriptor areas. Let SV be the value of the output parameter, with data type SDT.
  - If TYPE indicates USER-DEFINED TYPE, then let the most specific type of the i-th bound parameter whose value is SV be represented by the values of the SPECIFIC\_TYPE\_CATALOG, SPE-CIFIC\_TYPE\_SCHEMA, and SPECIFIC\_TYPE\_NAME fields in the corresponding item descriptor area of *IPD*.
  - Let TYPE, OL, DP, IP, and LP be the values of the TYPE, OCTET\_LENGTH, DATA\_POINTER, INDICATOR\_POINTER, and OCTET\_LENGTH\_POINTER fields, respectively, in the item descriptor area of APD corresponding to the i-th bound target (or part thereof, if the item descriptor area is a subordinate descriptor).
  - g) Case:
    - i) If TYPE indicates CHARACTER, then:

## ISO/IEC 9075-3:2016(E) 5.11 Implicit CALL USING clause

- 1) Let *UT* be the code value corresponding to CHARACTER VARYING as specified in Table 7, "Codes used for implementation data types in SQL/CLI".
- 2) Let *LV* be the implementation-defined maximum length for a CHARACTER VARYING data type.
- ii) Otherwise, let *UT* be *TYPE* and let *LV* be 0 (zero).
- h) Let *TDT* be the effective data type of the *i*-th bound target as represented by the type *UT*, the length value *LV*, and the values of the PRECISION, SCALE, CHARACTER\_SET\_CATALOG, CHARACTER\_SET\_SCHEMA, CHARACTER\_SET\_NAME, USER\_DEFINED\_TYPE\_ CATALOG, USER\_DEFINED\_TYPE\_SCHEMA, USER\_DEFINED\_TYPE\_NAME, SCOPE\_CATALOG, SCOPE\_SCHEMA, and SCOPE\_NAME fields in the corresponding item descriptor area of *APD* for which the LEVEL is 0 (zero) and all its subordinate descriptor areas.
- i) Case:
  - i) If *TDT* is a locator type, then

Case:

- 1) If SV is not the null value, then a locator L that uniquely identifies SV is generated and the value TV of the i-th bound target is set to an implementation-dependent four-octet value that represents L.
- 2) Otherwise, the value TV of the i-th bound target is the null value.
- ii) If SDT and TDT are predefined types, then

Case:

1) If the <cast specification>

does not conform to the Syntax Rules of Subclause 6.13, "<cast specification>", in [ISO9075-2], and there is an implementation-defined conversion from type *SDT* to type *TDT*, then that implementation-defined conversion is effectively performed, converting *SV* to type *TDT*, and the result is the value *TV* of the *i*-th bound target.

2) Otherwise:

If the <cast specification>

```
CAST ( SV AS TDT )
```

does not conform to the Syntax Rules of Subclause 6.13, "<cast specification>", in [ISO9075-2], then an exception condition is raised: *dynamic SQL error* — *restricted data type attribute violation*.

B) The <cast specification>

```
CAST ( SV AS TDT )
```

is effectively performed and the result is the value TV of the i-th bound target.

iii) If SDT is a user-defined type and TDT is a predefined data type, then:

- 1) Let DT be the data type identified by SDT.
- 2) If the current SQL-session has a group name corresponding to the user-defined name of DT, then let GN be that group name; otherwise, let GN be the default transform group name associated with the current SOL-session.
- The Syntax Rules of Subclause 9.25, "Determination of a from-sql function", in [ISO9075-2], are applied with DT as TYPE and GN as GROUP.

#### Case:

A) If there is an applicable from-sql function, then let FSF be that from-sql function and let *FSFRT* be the <returns data type> of *FSF*.

#### Case:

- If FSFRT is compatible with TDT, then the from-sqt function TSF is effectively I) invoked with SV as its input parameter and the result of evaluating TSF(SV) is the value TV of the i-th bound target.
- II) Otherwise, an exception condition is raised: dynamic SQL error — restricted data type attribute violation.
- B) Otherwise, an exception condition is raised. dynamic SQL error data type transform function violation.
- Let *IDA* be the top-level item descriptor area corresponding to the *i*-th output parameter.
- Case: k)
  - i) If TYPE indicates ROW, then

#### Case:

1) If TV is the null value, then

#### Case:

- A) If IP is a null pointer for IDA or for any of the subordinate descriptor areas of IDA that are not subordinate to an item descriptor area whose type indicates ARRAY, ARRAY LOCATOR, MULTISET, or MULTISET LOCATOR, then an exception condition is raised: data exception — null value, no indicator parameter.
- Otherwise, the value of the host variable addressed by IP for IDA, and those in all subordinate descriptor areas of *IDA* that are not subordinate to an item descriptor area whose TYPE indicates ARRAY, ARRAY LOCATOR, MULTISET, or MULTISET LOCATOR are set to the appropriate 'Code' for SQL NULL DATA in Table 27, "Miscellaneous codes used in CLI", and the values of variables addressed by DP and LP are implementation-dependent.
- 2) Otherwise, the i-th subordinate descriptor area of IDA is set to reflect the value of the i-th field of TV by applying GR 3)k) to the i-th subordinate descriptor area of IDA as IDA, the value of i-th field of TV as TV, the value of the i-th field of SV as SV, and the data type of the *i*-th field of SV as SDT.
- ii) Otherwise,

#### ISO/IEC 9075-3:2016(E) 5.11 Implicit CALL USING clause

1) If TV is the null value, then

- A) If IP is a null pointer, then an exception condition is raised: data exception null value, no indicator parameter.
- B) Otherwise, the value of the host variable addressed by IP is set to the appropriate 'Code' for SQL NULL DATA in Table 27, "Miscellaneous codes used in CLI" and the values of the host variables addressed by *DP* and *LP* are implementation dependent.
- 2) Otherwise:
  - A) If IP is not a null pointer, then the value of the host variable addressed by IP is set to 0 (zero).
  - B) Case:
    - I) If TYPE indicates CHARACTER or CHARACTER LARGE OBJECT, then:
      - 1) If TV is a zero-length character string, then it is implementation-defined whether or not an exception condition is raised: data exception — zerolength character string.
      - The General Rules of Subclause 5.14, "Character string retrieval", are applied with DP, TV, OL, and LP as TARGET, VALUE, TARGET OCTET LENGTH, and RETURNED OCTET LENGTH, respectively.
    - If TYPE indicates BINARY LARGE OBJECT, then the General Rules of II) Subclause 5.15, "Binary string retrieval", are applied with DP, TV, OL, and LP as TARGET, VALUE, TARGET OCTET LENGTH, and RETURNED OCTET LENGTH, respectively.
    - III) If TYPE indicates ARRAY, ARRAY LOCATOR, MULTISET, or MULTISET LOCATOR and if RETURNED CARDINALITY POINTER is not 0 (zero), then the value of the host variable addressed by RETURNED CARDINAL-ITY POINTER is set to the cardinality of TV.
    - Otherwise, the value of the host variable addressed by *DP* is set to *TV*.

# 5.12 Fetching a rowset

# **Subclause Signature**

```
"Fetching a rowset" [General Rules] (
 Parameter: "ALLOCATED STATEMENT",
 Parameter: "FETCH ORIENTATION",
 Parameter: "FETCH OFFSET"
```

# **Function**

Specify the rules for fetching a rowset.

- 1) Let S be the ALLOCATED STATEMENT, let FO be the FETCH ORIENTATION, and let OS be the FETCH OFFSET in an application of the General Rules of this Subclause
- 2) If there is no executed statement associated with S, then an exception condition is raised: CLI-specific *condition* — *function sequence error*.
- 3) If there is no open CLI cursor associated with *S*, then an exception condition is raised: *invalid cursor state*; otherwise, let  $\overline{CR}$  be the open CLI cursor associated with S and let T be the table associated with CR.
- 4) If FO is not one of the code values in Table 25, "Codes used for fetch orientation", then an exception condition is raised: *CLI-specific condition* invalid fetch orientation.
- 5) If the operational scrollability property of CR is NO SCROLL, and FO does not indicate NEXT, then an exception condition is raised: *CLI-specific condition* — invalid fetch orientation.
- 6) Let ARD be the current application row descriptor for S and let N be the value of the TOP\_LEVEL\_COUNT field of ARD.
- 7) Let AD be the value of the COUNT field in the header of ARD.
- 8) For each item descriptor area in ARD whose LEVEL is 0 (zero) in the first AD item descriptor areas of ARD, and for all of their subordinate descriptor areas, refer to a <target specification> whose corresponding item descriptor area has a non-zero value of DATA POINTER as a bound target and refer to the corresponding <select list> column as a bound column.
- 9) Let BC be the number of bound columns.
- 10) For all i, 1 (one)  $\leq i \leq BC$ :
  - a) Let IDA be the item descriptor area of ARD corresponding to the i-th bound target and let TT be the value of the TYPE field of IDA.
  - b) If TT indicates DEFAULT, then:
    - Let *IRD* be the implementation row descriptor associated with *S*. i)

# ISO/IEC 9075-3:2016(E) 5.12 Fetching a rowset

- ii) Let *CT*, *P*, and *SC* be the values of the TYPE, PRECISION, and SCALE fields, respectively, for the item descriptor area of *IRD* corresponding to the *i*-th bound column.
- iii) The data type, precision, and scale of the <target specification> described by *IDA* are effectively set to *CT*, *P*, and *SC*, respectively, for the purposes of this fetch only.

#### 11) Case:

- a) If FO indicates ABSOLUTE or RELATIVE, then let J be OS.
- b) If FO indicates NEXT or FIRST, then let J be +1.
- c) If FO indicates PRIOR or LAST, then let J be -1.
- 12) Let *R* be the rowset on which *CR* is positioned and let *AS* be the value of the ARRAY SIZE field in the header of *ARD*.
- 13) Let  $T_t$  be a result set of the same degree as T.

#### Case:

- a) If FO indicates ABSOLUTE, FIRST, or LAST, then let  $T_t$  contain all rows of T, preserving their order in T.
- b) If FO indicates NEXT, or indicates RELATIVE with a positive value of J, then

#### Case:

- i) If T is empty or if R contains the last row of T, then let  $T_t$  be a table of no rows.
- ii) If CR is positioned before the start of the result set, then let  $T_t$  contain all rows of T, preserving their order in T.
- iii) Otherwise, let  $T_t$  contain all rows of T after the last row of R, preserving their order in T.
- c) If FO indicates PRIOR or indicates RELATIVE with a negative value of J, then

#### Case:

- i) If T is empty or if R contains the first row of T, then let  $T_t$  be a table of no rows.
- ii) If CR is positioned after the end of the result set, then let  $T_t$  contain all rows of T, preserving their order in T.
- iii) Otherwise, let  $T_t$  contain all rows of T before the first row of R, preserving their order in T.
- d) AfFO indicates RELATIVE with a zero value of J, then

- i) If R is not empty, then let  $T_t$  be a result set comprising all the rows in R and all the rows of T after the last row of R, preserving their order in T.
- ii) Otherwise, let  $T_t$  be an empty table.
- 14) Let N be the number of rows in  $T_t$ . If J is positive, then let K be J. If J is negative, then let K be N+J+1. If J is zero, then let K be 1 (one).

- 15) Case:
  - a) If K is greater than 0 (zero), then

Case:

i) If (K + AS - 1) is greater than N, then

Case:

1) If J is less than 0 (zero), then

Case:

- A) If (K + AS 1) is greater than the number of rows in T, then CR is positioned on the rowset that has all the rows in T.
- B) Otherwise, CR is positioned on the rowset whose first row is the K-th row of T; that rowset has AS rows.
- 2) Otherwise, if K is less than N, then CR is positioned on the rowset that has all the rows in  $T_t$ .
- ii) Otherwise, CR is positioned on the rowset whose first row is the K-th row of  $T_t$ ; that rowset has AS rows.
- b) If K is less than 0 (zero), but the absolute value of K is less than or equal to AS, then

Case:

- If AS is greater than the number of rows in T, then CR is positioned on the rowset that has all i) the rows in T.
- Otherwise, CR is positioned on the rowset that has the first AS rows in T. ii)
- c) Otherwise, no SQL-data values are assigned and a completion condition is raised: no data.

Case:

- If FO indicates RELATIVE with J equal to zero, then the position of CR is unchanged. i)
- If FO indicates NEXT, indicates ABSOLUTE or RELATIVE with K greater than N, or indicates ii) LAST, then CR is positioned after the last row.
- Otherwise, FO indicates PRIOR, FIRST, or ABSOLUTE or RELATIVE with K not greater than N and CR is positioned before the first row.

No further rules of this Subclause are applied.

- 16) Let NR be the rowset on which CR is positioned. Let ASP and RPP be the values of the ARRAY\_STA-TUS POINTER and ROWS PROCESSED POINTER fields respectively in the header of the IRD of S.
- 17) If RPP is not a null pointer, then set the value of the host variable addressed by RPP to 0 (zero).
- 18) Let *ROWS\_DERIVED* be 0 (zero).
- 19) Let RS be the number of rows in NR.

For RN, 1 (one)  $\leq$  RN  $\leq$  RS, let R be the RN-th row of NR.

# ISO/IEC 9075-3:2016(E) 5.12 Fetching a rowset

#### Case:

- a) If an exception condition is raised during derivation of any <derived column> associated with *R* and *ASP* is not a null pointer, then set the *RN*-th element of *ASP* to 5 (indicating **Row error**). For all status records that result from the application of this Rule, the ROW\_NUMBER field is set to *RN* and the COLUMN\_NUMBER field is set to the appropriate column number, if any.
- b) Otherwise the row R is fetched and ROWS\_DERIVED is incremented by 1 (one).

#### 20) Case:

- a) If *ROWS\_DERIVED* is greater than 0 (zero), then:
  - i) Let SS be the select source associated with S.
  - ii) NR becomes the fetched rowset associated with S.
  - iii) The General Rules of Subclause 5.13, "Implicit FETCH USING clause", are applied with SS as SOURCE, RS as ROWS, and S as ALLOCATED STATEMENT) respectively, resulting in ROWS\_ASSIGNED.

#### Case:

- 1) If *ROWS\_ASSIGNED* is greater than 0 (zero), *ROWS\_ASSIGNED* is less than *AS*, and *ASP* is not 0 (zero), then set the *ROWS\_ASSIGNED*+1-th through *AS*-th elements of *ASP* to 3 (indicating **No row**). If *ROWS\_ASSIGNED* is less than *AS*, then a completion condition is raised: *warning*. If *RPP* is not a null pointer, then the value of the host variable addressed by *RPP* is set to the value of *ROWS\_ASSIGNED*.
- 2) If *ROWS\_ASSIGNED* is 0 (zero), then the values of all bound targets are implementation-dependent and *CR* remains positioned on *NR*.
- b) Otherwise, the values of all bound argets are implementation-dependent and *CR* remains positioned on *R*.
- 21) If *ROWS\_DERIVED* is greater than 0 (zero) and *ROWS\_ASSIGNED* is greater than 0 (zero), then the value of the CURRENT OF POSITION attribute of *S* is set to

- a) If AS is 1 (one) or if CR is scrollable, then 1 (one).
- b) Otherwise an implementation-defined value indicating the current row in the rowset.

## **5.13 Implicit FETCH USING clause**

## **Function**

Specify the rules for an implicit FETCH USING clause.

#### **General Rules**

- 1) Let S, RS, and AS be respectively a SOURCE, ROWS, and ALLOCATED STATEMENT specified in an application of this Subclause.
- 2) Let RA be 0 (zero).
- 3) Let IRD and ARD be the current implementation row descriptor and current application row descriptor, respectively, associated with AS.
- 4) IRD and ARD describe the <select list> columns and <target specification>s, respectively, for the column values that are to be retrieved. Let D be the degree of the table defined by S.
  - a) Let AD be the value of the COUNT field of ARD. If AD is less than zero, then an exception condition is raised: dynamic SOL error — invalid descriptor count?
  - b) For each item descriptor area in ARD whose LEVEL'S 0 (zero) in the first AD item descriptor areas of ARD, and for all of their subordinate descriptor areas, refer to a <target specification> whose corresponding item descriptor areas have a non-zero DATA\_POINTER as a bound target and refer to the corresponding <select list> column as a bound column.
  - c) If any item descriptor area corresponding to a bound target in the first AD item descriptor areas of ARD is not valid as specified in Subclause 5.18, "Description of CLI item descriptor areas", then an exception condition is raised: dynamic SQL error — using clause does not match target specifications.
  - d) Let *SDT* be the effective data type of the *i*-th bound column as represented by the values of the TYPE, LENGTH, PRECISION, SOALE, DATETIME\_INTERVAL\_CODE, DATETIME\_INTERVAL\_PRE-CISION, CHARACTER SET\_CATALOG, CHARACTER\_SET\_SCHEMA, CHARAC-TER\_SET\_NAME, USER\_DEFINED\_TYPE\_CATALOG, USER\_DEFINED\_TYPE\_SCHEMA, USER DEFINED TYPE NAME, SCOPE CATALOG, SCOPE SCHEMA, and SCOPE NAME fields in the *i*-th tem descriptor area of *IRD* whose LEVEL is 0 (zero) and all of its subordinate descriptor areas.
  - e) If TYPE indicates USER-DEFINED TYPE, then let the most specific type of the *i*-th bound column whose value is SV be represented by the values of the SPECIFIC TYPE CATALOG, SPE-CIPIC TYPE SCHEMA, and SPECIFIC TYPE NAME fields in the corresponding item descriptor area of IRD.
  - Let TYPE, OL, DP, IP, and LP be the values of the TYPE, OCTET LENGTH, DATA POINTER, INDICATOR\_POINTER, and OCTET\_LENGTH\_POINTER fields, respectively, in the item descriptor area of ARD corresponding to the i-th bound target (or part thereof, if the item descriptor area is a subordinate descriptor).
  - g) Let ASP be the value of the ARRAY\_STATUS\_POINTER field in IRD.
  - h) For RN ranging from 1 (one) through RS, if the RN-th row of the rowset has been fetched, then:

#### ISO/IEC 9075-3:2016(E) 5.13 Implicit FETCH USING clause

- Let SV be the value of the <select list> column, with data type SDT. i)
- ii) Let DPE, IPE, and LPE be the addresses of the RN-th element of the arrays addressed by DP, IP, and LP, respectively.
- iii) Case:
  - 1) If TYPE indicates CHARACTER, then:
    - A) Let UT be the code value corresponding to CHARACTER VARYING as specified in Table 7, "Codes used for implementation data types in SQL/CLI".
    - B) Let LV be the implementation-defined maximum length for a CHARACTER VARYING data type.
  - 2) Otherwise, let *UT* be *TYPE* and let *LV* be 0 (zero).
- Let TDT be the effective data type of the i-th bound target as represented by the type UT, the iv) length value LV, and the values of the PRECISION, SCALE, CHARACTER\_SET\_CATALOG, CHARACTER\_SET\_SCHEMA, CHARACTER\_SET\_NAME, USER DEFINED TYPE CATALOG, USER DEFINED TYPE SCHEMA, USER DEFINED TYPE NAME, SCOPE CATALOG, SCOPE SCHEMA, and SCOPE\_NAME fields in the item descriptor area of ARD whose LEVEL is 0 (zero) and all of its subordinate descriptor areas.
- Let LTDT be the data type on the last fetch of the i-th bound target, if any. If any of the following v) is true, then is implementation-defined whether or not an exception condition is raised: dynamic *SQL error* — restricted data type attribute violation.
  - 1) LTDT and TDT both identify a binary large object type and only one of LTDT and TDT is a binary large object locator.
  - 2) LTDT and TDT both identify a character large object type and only one of LTDT and TDT is a character large object locator.
  - 3) LTDT and TDT both identify an array type and only one of LTDT and TDT is an array locator.
  - 4) LTDT and TDT both identify a multiset type and only one of LTDT and TDT is a multiset locator
  - 5) LTDT and TDT both identify a user-defined type and only one of LTDT and TDT is a userdefined type locator.
- Case:
  - 1) If *TDT* is a locator type, then;
    - A) If SV is not the null value, then a locator L that uniquely identifies SV is generated and the value TV of the i-th bound target is set to an implementation-dependent four-octet value that represents L.
    - B) Otherwise, the value TV of the i-th bound target is the null value.
  - 2) If SDT and TDT are predefined types, then

A) If the <cast specification>

```
CAST ( SV AS TDT )
```

does not conform to the Syntax Rules of Subclause 6.13, "<cast specification>", in [ISO9075-2], and there is an implementation-defined conversion from type SDT to type TDT, then that implementation-defined conversion is effectively performed, converting SV to type TDT, and the result is the value TV of the i-th bound target.

- B) Otherwise:
  - I) If the <cast specification>

```
CAST ( SV AS TDT )
```

does not conform to the Syntax Rules of Subclause 6, 13, in [ISO9075-2], then an exception condition is raised: dynamic SQL error restricted data type attribute violation.

II) The <cast specification>

```
CAST ( SV AS TDT )
```

is effectively performed and the result is the value TV of the i-th bound target.

For every status record that results from the application of this Rule, the ROW NUMBER field is set to RN and the COLUMN NUMBER field is set to i. If ASP is not a null pointer, then the RN-th element of the array addressed by ASP is set to:

- If there were completion conditions: warning raised during the application of this Rule, then 6 (indicating **Row success with information**).
- If there were exception conditions raised during the application of this Rule, then 5 (indicating **Row error**).
- The <cast specification> III)

```
CAST ( SV AS TDT )
```

is effectively performed and the result is the value TV of the i-th bound target.

- If SDT is a user-defined type and TDT is a predefined data type, then:
  - A) Let DT be the data type identified by SDT.
  - B) If the current SQL-session has a group name corresponding to the user-defined name of DT, then let GN be that group name; otherwise, let GN be the default transform group name associated with the current SQL-session.
  - C) The Syntax Rules of Subclause 9.25, "Determination of a from-sql function", in [ISO9075-2], are applied with DT and GN as TYPE and GROUP, respectively.

Case:

I) If there is an applicable from-sql function, then let FSF be that from-sql function and let *FSFRT* be the <returns data type> of *FSF*.

#### ISO/IEC 9075-3:2016(E) 5.13 Implicit FETCH USING clause

#### Case:

- 1) If FSFRT is compatible with TDT, then the from-sql function TSF is effectively invoked with SV as its input parameter and the result of evaluating TSF(SV) is the value TV of the *i*-th bound target.
- Otherwise, an exception condition is raised: dynamic SOL error restricted data type attribute violation.
- Otherwise, an exception condition is raised: dynamic SQL error II) transform function violation.
- Let *IDA* be the top-level item descriptor area corresponding to the *i*-th bound column. vii)
- viii) Case:
  - 1) If TYPE indicates ROW, then

Case:

A) If TV is the null value, then

Case:

- I) If IPE is a null pointer for IDA or for any of the subordinate descriptor areas of *IDA* that are not subordinate to an item descriptor area whose type indicates ARRAY, ARRAY LOCATOR, MULTISET, or MULTISET LOCATOR, then an exception condition is raised: data exception — null value, no indicator parameter.
- Otherwise, the value of the host variable addressed by IPE for IDA, and that II) in all subordinate descriptor areas of *IDA* that are not subordinate to an item descriptor area whose TYPE indicates ARRAY, ARRAY LOCATOR, MUL-TISET, or MULTISET LOCATOR, is set to the appropriate 'Code' for SQL NULL DATA in Table 27, "Miscellaneous codes used in CLI", and the values of variables addressed by *DPE* and *LPE* are implementation-dependent.
- B) Otherwise, the *i*-th subordinate descriptor area of *IDA* is set to reflect the value of the *i*-th field of TV by applying GR 4)h)viii) to the *i*-th subordinate descriptor area of IDA as IDA, the value of i-th field of TV as TV, the value of the i-th field of SV as SV, and the data type of the *i*-th field of SV as SDT.
- Otherwise,

Case:

A) If TV is the null value, then

- I) If IPE is a null pointer, then an exception condition is raised: data exception — null value, no indicator parameter.
- II)Otherwise, the value of the host variable addressed by *IPE* is set to the appropriate 'Code' for SQL NULL DATA in Table 27, "Miscellaneous codes used in CLI", and the values of the host variables addressed by DPE and LPE are implementation-dependent.

#### B) Otherwise:

I) If IPE is not a null pointer, then the value of the host variable addressed by IPE is set to 0 (zero).

#### II) Case:

- 1) If TYPE indicates CHARACTER or CHARACTER LARGE OBJECT, then:
  - If TV is a zero-length character string, then it is implementation-defined a) whether or not an exception condition is raised: data exception zero-length character string.
  - The General Rules of Subclause 5.14, "Character string retrieval", are applied with DPE, TV, OL, and LPE as TARGET, VALUE, TARGET OCTET LENGTH, and RETURNED OCTET LENGTH, respectively.
  - c) For every status record that results from the application of the preceding Subrule, the ROW\_NUMBER field is set to RN and the COL-UMN\_NUMBER field is set to Of ASP is not a null pointer, then the RN-th element of the array addressed by ASP is set to:
    - If there were completion conditions: warning raised during the application of the preceding Subrule, then 6 (indicating **Row** success with information).
    - If there were exception conditions raised during the application ii) of the preceding Subrule, then 5 (indicating **Row error**).
- 2) If TYPE indicates BINARY, BINARY VARYING, or BINARY LARGE OBJECT, then the General Rules of Subclause 5.15, "Binary string retrieval, are applied with DPE, TV, OL, and LPE as TARGET, VALUE, TARGET OCTET LENGTH, and RETURNED OCTET LENGTH, respectively.

For every status record that results from the application of this Rule, the ROW\_NUMBER field is set to RN and the COLUMN\_NUMBER field is set to i. If ASP is not a null pointer, then the RN-th element of the array addressed by ASP is set to:

- If there were completion conditions: warning raised during the application of this Rule, then 6 (indicating **Row success with information**).
- If there were exception conditions raised during the application of this Rule, then 5 (indicating **Row error**).
- 3) If TYPE indicates ARRAY, ARRAY LOCATOR, MULTISET, or MUL-TISET LOCATOR, and if RETURNED\_CARDINALITY\_POINTER is not a null pointer, then the value of the host variable addressed by RETURNED\_CARDINALITY\_POINTER is set to the cardinality of TV.
- 4) Otherwise, the value of the host variable addressed by *DPE* is set to *TV* and the value of the host variable addressed by LPE is implementationdependent.

#### ISO/IEC 9075-3:2016(E) 5.13 Implicit FETCH USING clause

- 3) If there were no exception conditions raised during the application of this Rule, then:
  - A) RA is incremented by 1 (one).
  - B) If ASP is not a null pointer, then set the RN-th element of the array pointed to by ASP to 0 (zero, indicating **Row success**).
- 5) RA is the result of this Subclause.

## 5.14 Character string retrieval

## **Function**

Specify the rules for retrieving character string values.

#### **General Rules**

- 1) Let T, V, TL, and RL be a TARGET, VALUE, TARGET OCTET LENGTH, and RETURNED LENGTH specified in an application of this Subclause.
- 2) If TL is not greater than zero, then an exception condition is raised: CLI-specific condition invalid string length or buffer length.
- 3) Let L be the length in octets of V.
- 4) If RL is not a null pointer, then the value of the host variable addressed by RL is set to L.
- 5) Case:
  - a) If null termination is *False* for the current SQL-environment, then

Case:

- If L is not greater than TL, then the first Loctets of T are set to V and the values of the remaining i) octets of T are implementation-dependent.
- Otherwise, T is set to the first TL octets of V and a completion condition is raised: warning ii) string data, right truncation. 📢
- b) Otherwise, let NB be the length in octets of a null terminator in the character set of T.

- If L is not greater than (TL-NB), then the first (L+NB) octets of T are set to V concatenated with i) a single implementation-defined null character that terminates a C character string. The values of the remaining characters of T are implementation-dependent.
- Otherwise, T is set to the first (TL-NB) octets of V concatenated with a single implementationii) defined null character that terminates a C character string and a completion condition is raised: warning — string data, right truncation.

## 5.15 Binary string retrieval

## **Function**

Specify the rules for retrieving binary string values.

## **General Rules**

- 1) Let *T*, *V*, *TL*, and *RL* be a *TARGET*, *VALUE*, *TARGET OCTET LENGTH*, and *RETURNED OCTET LENGTH* specified in an application of this Subclause.
- 2) If TL is not greater than zero (0), then an exception condition is raised: CLI-specific condition invalid string length or buffer length.
- 3) Let L be the length in octets of V.
- 4) If RL is not a null pointer, then RL is set to L.
- 5) Case:
  - a) If L is not greater than TL, then the first L octets of T are set to V and the values of the remaining octets of T are implementation-dependent.
  - b) Otherwise, T is set to the first TL octets of V and a completion condition is raised: warning string data, right truncation.

## 5.16 Deferred parameter check

## **Function**

Check for the existence of deferred dynamic parameters when accessing a CLI descriptor.

## **General Rules**

- 1) Let DA be a DESCRIPTOR AREA specified in an application of this Subclause.
- 2) Let C be the allocated SQL-connection with which DA is associated.
- 3) Let L1 be the set of all allocated SQL-statements associated with C.
- 4) Let L2 be the set of all allocated SQL-statements in L1 which have an associated deferred parameter number.
- 5) Let L3 be the set of all CLI descriptor areas that are either the current application parameter descriptor for, or the implementation parameter descriptor associated with, an altocated SQL-statement in L2.
- raisedy, raisedy, click to view the full standards is o.com. Click to view the full standards is o.com. 6) If DA is contained in L3, then an exception condition is raised: CM-specific condition — function sequence

## 5.17 CLI-specific status codes

Some of the conditions that can occur during the execution of CLI routines are CLI-specific. The corresponding status codes are listed in Table 5, "SQLSTATE class and subclass codes for SQL/CLI-specific conditions".

Table 5 — SQLSTATE class and subclass codes for SQL/CLI-specific conditions

Category	Condition	Class	Subcondition	Subclass
X	CLI-specific condition	HY	(no subclass)	600
			associated statement is not pre-	007
			attempt to concatenate a null value	020
			attribute cannot be set now	011
			column type out of range	097
		. 120	dynamic parameter value needed	(See the Note at the end of the table)
		ien	function sequence error	010
	, 40		inconsistent descriptor information	021
	Click		invalid attribute identifier	092
	W.		invalid attribute value	024
	<u> </u>		invalid cursor position	109
	c is		invalid data type	004
	ORROS.		invalid data type in application descriptor	003
. 2	<b>D</b>		invalid descriptor field identifier	091
5			invalid fetch orientation	106
			invalid FunctionId specified	095
			invalid handle	(See the Note at the end of the table)

Category	Condition	Class	Subcondition	Subclass
			invalid information type	096
			invalid LengthPrecision value	104
			invalid parameter mode	105
			invalid retrieval code	103
			invalid string length or buffer length	090
			invalid transaction operation code	012
			invalid use of automatically-allo- cated descriptor handle	017
			invalid use of null pointer	009

NOTE 17 — No subclass code is defined for the subcondition *invalid handle* since no diagnostic information can be generated in this case, nor for the subcondition *dynamic parameter value needed*, since no diagnostic information is generated in this case.

## 5.18 Description of CLI item descriptor areas

This Subclause is modified by Subclause 19.3, "Description of CLI item descriptor areas", in ISO/IEC 9075-9.

## **Function**

Specify the identifiers, data types and codes for fields used in CLI item descriptor areas.

## **Syntax Rules**

- 1) A CLI item descriptor area comprises the fields specified in Table 6, "Fields in SQLCLI row and parameter descriptor areas".
- 2) Given a CLI item descriptor area *IDA* in which the value of LEVEL is some value *N*, the *immediately subordinate* descriptor areas of *IDA* are those CLI item descriptor areas in which the value of LEVEL is *N*+1 and whose position in the CLI descriptor area follows that of *IDA* and precedes that of any CLI item descriptor area in which the value of LEVEL is less than *N*+1. The subordinate descriptor areas of *IDA* are those CLI item descriptor areas that are immediately subordinate descriptor areas of *IDA* or that are subordinate descriptor areas of an CLI item descriptor area that is immediately subordinate to *IDA*.
- 3) Given a data type DT and its descriptor DE, the immediately subordinate descriptors of DE are defined to be

Case:

- a) If *DT* is ROW, then the field descriptors of the fields of *DT*. The *i*-th immediately subordinate descriptor is the descriptor of the *i*-th field of *DT*.
- b) If DT is ARRAY or MULTISET, then the descriptor of the associated element type of DT. The subordinate descriptors of DE are those descriptors that are immediately subordinate descriptors of DE or that are subordinate descriptors of a descriptor that is immediately subordinate to DE.
- 4) Given a descriptor *DE*, let *SDE*<sub>j</sub> represent its *j*-th immediately subordinate descriptor. There is an implied ordering of the subordinate descriptors of *DE*, such that:
  - a)  $SDE_1$  is in the first ordinal position.
  - b) The ordinal position of  $SDE_{j+1}$  is K+NS+1, where K is the ordinal position of  $SDE_j$  and NS is the number of subordinate descriptors of  $SDE_j$ . The implicitly ordered subordinate descriptors of  $SDE_j$  occupy contiguous ordinal positions starting at position K+1.
- 5) Let *IDA* be an item descriptor area in an implementation parameter descriptor. *IDA* is *valid* if and only if all of the following are true:
  - a) TYPE is one of the code values in Table 7, "Codes used for implementation data types in SQL/CLI".
  - b) If LEVEL is 0 (zero) for *IDA*, then let *TLC* be the value of TOP\_LEVEL\_COUNT of the implementation parameter descriptor associated with *IDA*. *IDA* shall be one of exactly *TLC* item descriptor areas in the implementation parameter descriptor.
  - c) Exactly one of the following is true:

- TYPE indicates CHARACTER or CHARACTER VARYING, or CHARACTER LARGE i) OBJECT and LENGTH is a valid length value for a <character string type>.
- TYPE indicates BINARY, BINARY VARYING, or BINARY LARGE OBJECT and LENGTH ii) is a valid length value for a <binary string type>.
- TYPE indicates NUMERIC and PRECISION and SCALE are valid precision and scale values iii) for the NUMERIC data type.
- TYPE indicates DECIMAL and PRECISION and SCALE are valid precision and seale values iv) for the DECIMAL data type.
- TYPE indicates SMALLINT, INTEGER, BIGINT, REAL, or DOUBLE PRECISION. v)
- TYPE indicates FLOAT and PRECISION is a valid precision value for the FLOAT data type. vi)
- TYPE indicates DECFLOAT and PRECISION is a valid precision value for the DECFLOAT vii) data type.
- TYPE indicates BOOLEAN. viii)
- TYPE indicates a <datetime type>, DATETIME\_INTERVAL\_CODE is one of the code values ix) in Table 9, "Codes associated with datetime data types in SQL/CLI", and PRECISION is a valid precision value for the <time precision> or <timestamp precision> of the indicated datetime data type.
- TYPE indicates an <interval type>, DATETIME\_INTERVAL\_CODE is one of the code values x) in Table 10, "Codes associated with <interval qualifier> in SQL/CLI", to indicate the <interval qualifier> of the interval data type, DATETIME INTERVAL PRECISION is a valid <interval leading field precision>, and PRECISION is a valid precision value for <interval fractional seconds precision>, if applicable.
- TYPE indicates USER-DEFINED TYPE. xi)
- TYPE indicates REF. xii)
- TYPE indicates ROW, the value N of DEGREE is a valid value for the degree of a row type, there are exactly N immediately subordinate descriptor areas of IDA, and those item descriptor areas are valid.
- 109 TYPE indicates ARRAY or ARRAY LOCATOR, the value of CARDINALITY is a valid value for the maximum cardinality of an array, there is exactly one immediately subordinate descriptor area of *IDA*, and that item descriptor area is valid.
- TYPE indicates an implementation-defined data type.
- 6) Let HU be the programming language of the invoking host program. Let operative data type correspondence table be the data type correspondence table for HL as specified in Subclause 5.20, "SQL/CLI data type correspondences". Refer to the two columns of the operative data type correspondence table as the SOL data type column and the host data type column.
- 7) A CLI item descriptor area in a CLI descriptor area that is not an implementation row descriptor is *consistent* if and only if all of the following are true:
  - a) TYPE indicates DEFAULT or is one of the code values in Table 8, "Codes used for application data types in SQL/CLI".

#### ISO/IEC 9075-3:2016(E) 5.18 Description of CLI item descriptor areas

- b) All of the following are true:
  - i) TYPE is one of the code values in Table 8, "Codes used for application data types in SQL/CLI".
  - ii) TYPE is neither ROW, ARRAY, nor MULTISET.
  - iii) The row that contains the SQL data type corresponding to TYPE in the SQL data type column of the operative data type correspondence table does not contain "None" in the host data type column.
- c) Exactly one of the following is true:
  - i) TYPE indicates NUMERIC and PRECISION and SCALE are valid precision and scale values for the NUMERIC data type.
  - ii) TYPE indicates DECIMAL and PRECISION and SCALE are valid precision and scale values for the DECIMAL data type.
  - iii) TYPE indicates FLOAT and PRECISION is a valid precision value for the FLOAT data type.
  - iv) TYPE indicates DEFAULT, CHARACTER, CHARACTER LARGE OBJECT, CHARACTER LARGE OBJECT LOCATOR, BINARY, BINARY VARYING, BINARY LARGE OBJECT, BINARY LARGE OBJECT LOCATOR, SMALLINT, INTEGER, BIGINT, REAL, DOUBLE PRECISION, USER-DEFINED TYPE LOCATOR, or REF.
  - v) TYPE indicates ROW and, where *N* is the value of the DEGREE field in the corresponding item descriptor area in the implementation parameter descriptor, there are exactly *N* immediately subordinate descriptor areas of *IDA*, and those item descriptor areas are valid.
  - vi) TYPE indicates ARRAY, ARRAY LOCATOR, MULTISET, or MULTISET LOCATOR, there is exactly 1 (one) immediately subordinate descriptor area of *IDA*, and that item descriptor area is valid.
  - vii) TYPE indicates an implementation-defined data type.
- 8) Let *IDA* be a CLI item descriptor area in an application parameter descriptor. Let *IDA1* be the corresponding item descriptor area in the implementation parameter descriptor.
- 9) If the OCTET\_LENGTH POINTER field of *IDA* has the same non-zero value as the INDICATOR POINTER field of *IDA*, then *SHARE* is true for *IDA*; otherwise, *SHARE* is false for *IDA*.
- 10) Case:
  - a) If *SHARE* is true and the value of the commonly addressed host variable is the appropriate 'Code' for SQL NULL DATA in Table 27, "Miscellaneous codes used in CLI", then *NULL* is true for *IDA*.
  - b) If SHARE is false, INDICATOR\_POINTER is not zero, and the value of the host variable addressed by INDICATOR\_POINTER is the appropriate 'Code' for SQL NULL DATA in Table 27, "Miscellaneous codes used in CLI", then NULL is true for IDA.
  - c) Otherwise, *NULL* is false for *IDA*.
- 11) If *NULL* is false, OCTET\_LENGTH\_POINTER is not zero, and the value of the host variable addressed by OCTET\_LENGTH\_POINTER the appropriate 'Code' for DATA AT EXEC in Table 27, "Miscellaneous codes used in CLI", then *DEFERRED* is true for *IDA*; otherwise, *DEFERRED* is false for *IDA*.
- 12) *IDA* is *valid* if and only if:

- TYPE is one of the code values in Table 8, "Codes used for application data types in SQL/CLI", and at least one of the following is true:
  - TYPE is ROW, ARRAY, or MULTISET. i)
  - ii) The row of the operative data type correspondences table that contains the SQL data type corresponding to the value of TYPE in the SOL data type column does not contain 'None' in the host data type column.
- b) If LEVEL is 0 (zero) for *IDA*, then let *TLC* be the value of TOP\_LEVEL\_COUNT in the application parameter descriptor associated with IDA. IDA shall be one of exactly TLC item descriptor areas in the implementation parameter descriptor.
- One of the following is true:

- TYPE indicates CHARACTER, CHARACTER LARGE OBJECT, BINARY, BINARY i) VARYING, or BINARY LARGE OBJECT, and one of the following is true:
  - 1) *NULL* is true.
  - 2) *DEFERRED* is true.
  - OCTET\_LENGTH\_POINTER is not zero, PARAMETER\_MODE in *IDA1* is PARAM MODE IN or PARAM MODE INOUT, the value V of the host variable addressed by OCTET\_LENGTH\_POINTER is greater than zero, and the number of characters wholly contained in the first V octets of the host variable addressed by DATA POINTER is a valid length value for a CHARACTER, CHARACTER LARGE OBJECT, BINARY. BINARY VARYING, or BINARY LARGE OBJECT data type, as indicated by TYPE.
  - OCTET LENGTH POINTER is not zero. PARAMETER MODE in IDA1 is PARAM MODE IN or PARAMMODE INOUT, the value of the host variable addressed by OCTET LENGTH POINTER indicates NULL TERMINATED, and the number of characters of the value of the host variable addressed by DATA POINTER that precede the implementation-defined null character that terminates a C character string is a valid length value for a CHARACTER, CHARACTER LARGE OBJECT, BINARY, BINARY VARYING, or BINARY LARGE OBJECT data type, as indicated by TYPE.
  - OCTET\_LENGTH\_POINTER is zero, PARAMETER\_MODE in *IDA1* is PARAM MODE IN or PARAM MODE INOUT, and the number of characters of the value of the host variable addressed by DATA\_POINTER that precede the implementation-defined null character that terminates a C character string is a valid length value for a CHARACTER, CHARACTER LARGE OBJECT, BINARY, BINARY VARYING, or BINARY LARGE OBJECT data type, as indicated by TYPE.
  - 6) PARAMETER MODE in *IDA1* is PARAM MODE OUT.
- TYPE indicates CHARACTER LARGE OBJECT LOCATOR, BINARY LARGE OBJECT ii) LOCATOR, or USER-DEFINED TYPE LOCATOR and one of the following is true:
  - 1) *NULL* is true.
  - 2) DEFERRED is true.
- TYPE indicates NUMERIC and PRECISION and SCALE are valid precision and scale values iii) for the NUMERIC data type.

#### ISO/IEC 9075-3:2016(E)

#### 5.18 Description of CLI item descriptor areas

- iv) TYPE indicates DECIMAL and PRECISION and SCALE are valid precision and scale values for the DECIMAL data type.
- v) TYPE indicates SMALLINT, INTEGER, BIGINT, REAL, or DOUBLE PRECISION.
- vi) TYPE indicates FLOAT and PRECISION is a valid precision value for the FLOAT data type.
- vii) TYPE indicates REF and one of the following is true:
  - 1) NULL is true.
  - 2) DEFERRED is true.
- viii) TYPE indicates ROW and, where *N* is the value of the DEGREE field in the corresponding item descriptor area in the implementation parameter descriptor, there are exactly *N* immediately subordinate descriptor areas of *IDA*, and those item descriptor areas are valid.
- ix) OF TYPE indicates ARRAY, ARRAY LOCATOR, MULTISET, or MULTISET LOCATOR, there is exactly 1 (one) immediately subordinate descriptor area of IDA, and that item descriptor area is valid.
- x) TYPE indicates an implementation-defined data type
- d) One of the following is true:
  - i) DATA POINTER is zero and *NULL* is true.
  - ii) DATA\_POINTER is zero and *DEFERRED* is true.
  - iii) DATA\_POINTER is not zero and exactly one of the following is true:
    - 1) NULL is true.
    - 2) DEFERRED is true.
    - 3) PARAMETER\_MODE in *IDA1* is PARAM MODE IN or PARAM MODE INOUT and the value of the host variable addressed by DATA\_POINTER is a valid value of the data type indicated by TYPE.
    - 4) PARAMETER MODE in *IDA1* is PARAM MODE OUT.
- 13) A CLI item descriptor area in an application row descriptor is *valid* if and only if:
  - a) TYPE is one of the code values in Table 8, "Codes used for application data types in SQL/CLI", and at least one of the following is true:
    - i) TYPE is ROW, ARRAY, or MULTISET.
      - The row of the operative data type correspondences table that contains the SQL data type corresponding to the value of TYPE in the SQL data type column does not contain 'None' in the host data type column.
  - b) If LEVEL is 0 (zero) for *IDA*, then let *TLC* be the value of TOP\_LEVEL\_COUNT in the application parameter descriptor associated with *IDA*. *IDA* shall be one of exactly *TLC* item descriptor areas in the implementation parameter descriptor.
  - c) One of the following is true:

- TYPE indicates NUMERIC and PRECISION and SCALE are valid precision and scale values i) for the NUMERIC data type.
- ii) TYPE indicates DECIMAL and PRECISION and SCALE are valid precision and scale values for the DECIMAL data type.
- TYPE indicates FLOAT and PRECISION is a valid precision value for the FLOAT data type. iii)
- [10] TYPE indicates CHARACTER, CHARACTER LARGE OBJECT, CHARACTER LARGE iv) OBJECT LOCATOR, BINARY, BINARY VARYING, BINARY LARGE OBJECT, BINARY LARGE OBJECT LOCATOR, SMALLINT, INTEGER, BIGINT, REAL, DOUBLE PRECI-SION, USER-DEFINED TYPE LOCATOR, or REF.
- TYPE indicates ROW and, where N is the value of the DEGREE field in the corresponding v) item descriptor area in the implementation parameter descriptor, there are exactly N immediately subordinate descriptor areas of *IDA*, and those item descriptor areas are valid.
- TYPE indicates ARRAY, ARRAY LOCATOR, MULTISET, or MULTISET LOCATOR, vi) there is exactly 1 (one) immediately subordinate descriptor area of IDA, and that item descriptor area is valid.
- TYPE indicates an implementation-defined data type. vii)
- 14) Table 6, "Fields in SQL/CLI row and parameter descriptor areas", specifies the codes associated with userdefined types in SQL/CLI.

Table 6 — Fields in SQL/CLI row and parameter descriptor areas

### 5.20 SQL/CLI data type correspondences

This Subclause is modified by Subclause 19.5, "SQL/CLI data type correspondences", in ISO/IEC 9075-9. This Subclause is modified by Subclause 19.1, "SQL/CLI data type correspondences", in ISO/IEC 9075-14.

#### **Function**

Specify the SQL/CLI data type correspondences for SQL data types and host language types associated with the required parameter mechanisms, as shown in Table 3, "Supported calling conventions of SQL/CLI routines by language".

In the following tables, let P be crecision>, S be <scale>, L be <length>, T be <time fractional seconds precision>, and Q be <interval qualifier>.

#### **Tables**

19 14 Table 40 — SQL/CLI data type correspondences for Ada

SQL Data Type	Ada Data Type
ARRAY	None
ARRAY LOCATOR	SQL_STANDARD.INT
BIGINT	SQL_STANDARD.BIGINT
BINARY (L)	SQL_STANDARD.CHAR, with P'LENGTH of L
BINARY LARGE OBJECT (L)	SQL_STANDARD.CHAR, with P'LENGTH of L
BINARY LARGE OBJECT LOCATOR	SQL_STANDARD.INT
BINARY VARYING (b)	SQL_STANDARD.CHAR, with P'LENGTH of L
BOOLEAN	SQL_STANDARD.BOOLEAN
CHARACTER (L)	SQL_STANDARD.CHAR, with P'LENGTH of L
CHARACTER LARGE OBJECT	SQL_STANDARD.CHAR, with P'LENGTH of L
CHARACTER LARGE OBJECT LOCATOR	SQL_STANDARD.INT
CHARACTER VARYING (L)	None

DECFLOAT(P)	None
DECIMAL(P,S)	None
DOUBLE PRECISION	double
FLOAT(P)	None Nill
INTEGER	long
INTERVAL(Q)	None
MULTISET	None
MULTISET LOCATOR	long
NUMERIC(P,S)	None
REAL	float
REF	char, with length $L$
ROW NO	None
SMALLINT	short
TIME(T)	None
TIMESTAMP(T)	None
USER-DEFINED TYPE	None
USER-DEFINED TYPE LOCATOR	long

SQL Data Type	C Data Type
$^{1}$ $k$ is the length in units of C <b>char</b> of the largest character in the character set associated with the SQL data type.	

199 14 Table 42 — SQL/CLI data type correspondences for COBOL

SQL Data Type	COBOL Data Type
ARRAY	None 3.7
ARRAY LOCATOR	PICTURE S9(PI) USAGE BINARY, where PI is implementation-defined
BIGINT	PICTURE S9(BPI) USAGE BINARY, where BPI is implementation-defined
BINARY (L)	alphanumeric, with length $L$
BINARY LARGE OBJECT (L)	alphanumeric, with length L
BINARY LARGE OBJECT LOCATOR	PICTURE S9(PI) USAGE BINARY, where PI is implementation-defined
BINARY VARYING (L)	alphanumeric, with length $L$
BOOLEAN	PICTURE X
CHARACTER (L)	alphanumeric, with length $L$
CHARACTER LARGE OBJECT (L)	alphanumeric, with length $L$
CHARACTER LARGE OBJECT LOCATOR	PICTURE S9(PI) USAGE BINARY, where PI is implementation-defined
CHARACTER VARYING (L)	None
DATE	None
DECFLOAT(P)	None
DECIMAL(P,S)	None
DOUBLE PRECISION	None
FLOAT(P)	None
INTEGER	PICTURE S9(PI) USAGE BINARY, where PI is implementation-defined
INTERVAL(Q)	None

SQL Data Type	COBOL Data Type
MULTISET	None
MULTISET LOCATOR	PICTURE S9(PI) USAGE BINARY, where PI is implementation-defined
NUMERIC(P,S)	USAGE DISPLAY SIGN LEADING SEPARATE, with PICTURE as specified <sup>1</sup>
REAL	None
REF	alphanumeric, with length $L$
ROW	None
SMALLINT	PICTURE S9(SPI) USAGE BINARY where SPI is implementation-defined
TIME(T)	None
TIMESTAMP(T)	None
USER-DEFINED TYPE	None
USER-DEFINED TYPE LOCATOR	PICTURE S9(P) USAGE BINARY, where PI is implementation-defined

# <sup>1</sup> Case:

- If S = P, then a PICTURE with an 'S' followed by a 'V' followed by P '9's.
- If P > S > 0 (zero), then a PICTURE with an 'S' followed by P S '9's followed by a 'V' followed by S '9's.
- If S = 0 (zero), then a PICTURE with an 'S' followed by P '9's optionally followed by a 'V'.

## 100 Table 43 — SQL/CLI data type correspondences for Fortran

SQL Data Type	Fortran Data Type

## **SQL/CLI** routines

This Clause is modified by Clause 20, "SQL/CLI routines", in ISO/IEC 9075-9.

Subclause 5.1, "<CLI routine>", defines a generic CLI routine. This Subclause describes the individual CLI routines in alphabetical order.

For convenience, the variable <CLI name prefix> is omitted and the <CLI generic name> is used for the view the full PDF of Ison Eson descriptions. For presentation purposes (and purely arbitrarily), the routines are presented as functions rather than as procedures.

#### 6.1 **AllocConnect**

#### **Function**

Allocate an SQL-connection and assign a handle to it.

#### **Definition**

```
AllocConnect (
    EnvironmentHandle
    ConnectionHandle
    RETURNS SMALLINT
```

#### **General Rules**

- 1) Let *EH* be the value of EnvironmentHandle.
- 2) AllocHandle is implicitly invoked with HandleType indicating CONNECTION HANDLE, with EH as the value of InputHandle and with ConnectionHandle as OutputHandle.

#### 6.2 AllocEnv

#### **Function**

Allocate an SQL-environment and assign a handle to it.

### **Definition**

```
AllocEnv (
    EnvironmentHandle
                           OUT
                                      INTEGER )
    RETURNS SMALLINT
```

### **General Rules**

OIIEC 9015.3:2016 STANDARDS SO. COM. Click to view the full public 1) AllocHandle is implicitly invoked with HandleType indicating ENVIRONMENT HANDLE, with zero as the value of InputHandle, and with EnvironmentHandle as OutputHandle.

#### 6.3 AllocHandle

#### **Function**

Allocate a resource and assign a handle to it.

#### **Definition**

```
AllocHandle (
   HandleType IN SMALLINT,
   InputHandle IN INTEGER,
   OutputHandle OUT INTEGER)
   RETURNS SMALLINT
```

#### **General Rules**

- 1) Let HT be the value of HandleType and let IH be the value of InputHandle.
- 2) If HT is not one of the code values in Table 14, "Codes used for SQL/CLI handle types", then an exception condition is raised: CLI-specific condition invalid handle.
- 3) Case:
  - a) If HT indicates ENVIRONMENT HANDLE, then:
    - i) If the maximum number of SQL-environments that can be allocated at one time has already been reached, then an exception condition is raised: *CLI-specific condition limit on number of handles exceeded*. A skeleton SQL-environment is allocated and is assigned a unique value that is returned in Output Handle.
    - ii) Case:
      - 1) If the memory requirements to manage an SQL-environment cannot be satisfied, then OutputHandle is set to zero and an exception condition is raised: *CLI-specific condition memory allocation error*.
        - NOTE 19 No diagnostic information is generated in this case as there is no valid environment handle that can be used in order to obtain diagnostic information.
        - If the resources to manage an SQL-environment cannot be allocated for implementation-defined reasons, then an implementation-defined exception condition is raised. A skeleton SQL-environment is allocated and is assigned a unique value that is returned in OutputHandle.
      - 3) Otherwise, the resources to manage an SQL-environment are allocated and are referred to as an allocated SQL-environment. The allocated SQL-environment is assigned a unique value that is returned in OutputHandle.
  - b) If HT indicates CONNECTION HANDLE, then:
    - i) If *IH* does not identify an allocated SQL-environment or if it identifies an allocated skeleton SQL-environment, then OutputHandle is set to zero and an exception condition is raised: *CLI-specific condition invalid handle*.

# ISO/IEC 9075-3:2016(E) 6.3 AllocHandle

- ii) Let *E* be the allocated SQL-environment identified by *IH*.
- iii) The diagnostics area associated with E is emptied.
- iv) If the maximum number of SQL-connections that can be allocated at one time has already been reached, then OutputHandle is set to zero and an exception condition is raised: *CLI-specific condition limit on number of handles exceeded*.
- v) Case:
  - 1) If the memory requirements to manage an SQL-connection cannot be satisfied, then OutputHandle is set to zero and an exception condition is raised: *CLI-specific condition memory allocation error*.
  - 2) If the resources to manage an SQL-connection cannot be allocated for implementation-defined reasons, then OutputHandle is set to zero and an implementation-defined exception condition is raised.
  - 3) Otherwise, the resources to manage an SQL-connection are allocated and are referred to as an *allocated SQL-connection*. The allocated SQL-connection is associated with *E* and is assigned a unique value that is returned in OutputHandle.

#### c) If HT indicates STATEMENT HANDLE, then:

- i) If *IH* does not identify an allocated SQL-connection, then OutputHandle is set to zero and an exception condition is raised: *CLI-specific condition invalid handle*.
- ii) Let C be the allocated SQL-connection identified by IH.
- iii) The diagnostics area associated with *C* is emptied.
- iv) If there is no established SQL-connection associated with C, then OutputHandle is set to zero and an exception condition is raised: connection exception connection does not exist. Otherwise, let EC be the established SQL-connection associated with C.
- v) If the maximum number of SQL-statements that can be allocated at one time has already been reached, then OutputHandle is set to zero and an exception condition is raised: *CLI-specific condition*—*limit on number of handles exceeded*.
- vi) If EC is not the current SQL-connection, then the General Rules of Subclause 5.3, "Implicit set connection", are applied with EC as dormant SQL-connection.
- vii) If the memory requirements to manage an SQL-statement cannot be satisfied, then OutputHandle is set to zero and an exception condition is raised: *CLI-specific condition memory allocation error*.
- If the resources to manage an SQL-statement cannot be allocated for implementation-defined reasons, then OutputHandle is set to zero and an implementation-defined exception condition is raised.
- ix) The resources to manage an SQL-statement are allocated and are referred to as an *allocated SQL-statement*. The allocated SQL-statement is associated with *C* and is assigned a unique value that is returned in OutputHandle.
- x) The following CLI descriptor areas are automatically allocated and associated with the allocated SQL-statement:

- 1) An implementation parameter descriptor.
- 2) An implementation row descriptor.
- 3) An application parameter descriptor.
- 4) An application row descriptor.

For each of these descriptor areas, the ALLOC\_TYPE field is set to indicate AUTOMATIC. For each of these descriptor areas, fields with non-blank entries in Table 24, "SQL/QLP descriptor field default values", are set to the specified default values. All other fields in the CLI item descriptor areas are initially undefined.

- xi) The statement attributes of the allocated SQL statement are set as follows
  - The automatically allocated application parameter descriptor becomes the value of the APD HANDLE attribute for the allocated SQL-statement and the automatically allocated application row descriptor becomes the value of the ARD HANDLE attribute for the allocated SQL-statement.
  - The automatically allocated implementation parameter descriptor becomes the value of the IPD HANDLE attribute for the allocated SQL-statement and the automatically allocated implementation row descriptor becomes the value of the IRD HANDLE attribute for the allocated SQL-statement.
  - 3) The CURSOR SCROLLABLE attribute is set to NONSCROLLABLE.
  - 4) The CURSOR SENSITIVITY attribute is set to ASENSITIVE.
  - 5) The CURSOR HOLDABLE attribute is set to NONHOLDABLE.
  - 6) The CURRENT OF POSITION attribute is set to 1 (one).
  - 7) The NEST DESCRIPTOR attribute is set to FALSE.
- xii) The cursor name property associated with the allocated SQL-statement is set to a unique implementation-dependent name that has the prefix 'SQLCUR' or the prefix 'SQL\_CUR'.
- d) If HT indicates DESCRIPTOR HANDLE, then:
  - i) If *IH* does not identify an allocated SQL-connection then OutputHandle is set to zero and an exception condition is raised: *CLI-specific condition invalid handle*.
  - ii) Let C be the allocated SQL-connection identified by IH.
  - iii) The diagnostics area associated with C is emptied.
  - If there is no established SQL-connection associated with *C*, then OutputHandle is set to zero and an exception condition is raised: *connection exception connection does not exist*. Otherwise, let *EC* be the established SQL-connection associated with *C*.
    - v) If the maximum number of CLI descriptor areas that can be allocated at one time has already been reached, then OutputHandle is set to zero and an exception condition is raised: *CLI-specific condition limit on number of handles exceeded*.
    - vi) If *EC* is not the current SQL-connection, then the General Rules of Subclause 5.3, "Implicit set connection", are applied with EC as *dormant SQL-connection*.

# ISO/IEC 9075-3:2016(E) 6.3 AllocHandle

#### vii) Case:

- 1) If the memory requirements to manage a CLI descriptor area cannot be satisfied, then OutputHandle is set to zero and an exception condition is raised: *CLI-specific condition memory allocation error*.
- 2) If the resources to manage a CLI descriptor area cannot be allocated for implementation-defined reasons, then OutputHandle is set to zero and an implementation-defined exception condition is raised.
- Otherwise, the resources to manage a CLI descriptor area are allocated and are referred to as an allocated CLI descriptor area. The allocated CLI descriptor area is associated with C and is assigned a unique value that is returned in OutputHandle. The ALLOC\_TYPE field of the allocated CLI descriptor area is set to indicate USER. Other fields of the allo-STANDARDS GO. COM. Click to view the full Parts of STANDARDS GO. cated CLI descriptor area are set to the default values for an ARD specified in Table 24, "SQL/CLI descriptor field default values". Fields in the CLI item descriptor areas not set

#### 6.4 **AllocStmt**

#### **Function**

Allocate an SQL-statement and assign a handle to it.

#### **Definition**

```
AllocStmt (
    ConnectionHandle
                          IN
                                   INTEGER,
    StatementHandle
                          OUT
                                   INTEGER )
    RETURNS SMALLINT
```

#### **General Rules**

- 1) Let *CH* be the value of ConnectionHandle.
- of 15011EC 9015-3:2016 2) AllocHandle is implicitly invoked with HandleType indicating STATEMENT HANDLE, with *CH* as the value of InputHandle, and with StatementHandle as OutputHandle.

### 6.5 BindCol

#### **Function**

Describe a target specification or array of target specifications.

#### **Definition**

```
BindCol (
   StatementHandle
                       TN
                                 INTEGER,
   ColumnNumber
                       IN
                                 SMALLINT,
   TargetType
                       IN
                                 SMALLINT,
   TargetValue
                       DEFOUT
                                 ANY.
                       IN
   BufferLength
                                 INTEGER.
   StrLen_or_Ind
                       DEFOUT
                                 INTEGER )
   RETURNS SMALLINT
```

#### **General Rules**

- 1) Let S be the allocated SQL-statement identified by StatementHandle.
- 2) Let HV be the value of the handle of the current application row descriptor for S.
- 3) Let *ARD* be the allocated CLI descriptor area identified by *HV* and let *N* be the value of the TOP\_LEVEL\_COUNT field of *ARD*.
- 4) Let *CN* be the value of ColumnNumber.
- 5) If CN is less than 1 (one), then an exception condition is raised: dynamic SQL error invalid descriptor index.
- 6) If CN is greater than N, then

#### Case:

- a) If the memory requirements to manage the larger ARD cannot be satisfied, then an exception condition is raised: CLL specific condition memory allocation error.
- b) Otherwise, the TOP\_LEVEL\_COUNT field of *ARD* is set to *CN* and the COUNT field of *ARD* is incremented by 1 (one).
- 7) Let *TT* be the value of TargetType.
- 8) Let *HL* be the programming language of the invoking host program. Let *operative data type correspondence table* be the data type correspondence table for *HL* as specified in Subclause 5.20, "SQL/CLI data type correspondences". Refer to the two columns of the operative data type correspondences table as the *SQL data type column* and the *host data type column*.
- 9) If either of the following is true, then an exception condition is raised: *CLI-specific condition invalid data type in application descriptor*.
  - a) TT does not indicate DEFAULT and is not one of the code values in Table 8, "Codes used for application data types in SQL/CLI".

- b) TT is one of the code values in Table 8, "Codes used for application data types in SQL/CLI", but the row that contains the corresponding SQL data type in the SQL data type column of the operative data type correspondence table contains 'None' in the host data type column.
- 10) Let *BL* be the value of BufferLength.
- 11) If *BL* is not greater than zero, then an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.
- 12) Let *IDA* be the item descriptor area of *ARD* specified by *CN*.
- 13) If an exception condition is raised in any of the following General Rules, then the TYPE, OCTET\_LENGTH, LENGTH, DATA\_POINTER, INDICATOR\_POINTER, and OCTET\_LENGTH\_POINTER fields of *IDA* are set to implementation-dependent values and the value of COUNT for *ARD* is unchanged.
- 14) The data type of the <target specification> described by *IDA* is set to *TT*.
- 15) The length in octets of the <target specification> described by *IDA* is set to *BD*.
- 16) The length in characters or positions of the <target specification> described by *IDA* is set to the maximum number of characters or positions that may be represented by the data type *TT*.
- 17) The address of the host variable or array of host variables that is to receive a value or values for the <target specification> or <target specification>s described by *IDA* is set to the address of TargetValue. If Target-Value is a null pointer, then the address is set to 0 (zero).
- 18) The address of the <indicator variable> or array of <indicator variable>s associated with the host variable or host variables addressed by the DATA\_POINTER field of *IDA* is set to the address of StrLen\_or\_Ind.
- 19) The address of the host variable or array of host variables that is to receive the returned length (in characters) of the <target specification> or <target specification>s described by *IDA* is set to the address of StrLen\_or\_Ind.
- 20) Restrictions on the differences allowed between *ARD* and *IRD* are implementation-defined, except as specified in the General Rules of Subclause 5.13, "Implicit FETCH USING clause", and the General Rules of Subclause 6.30, "GetData"

**SQL/CLI routines** 131

#### **BindParameter** 6.6

#### **Function**

Describe a dynamic parameter specification and its value.

#### **Definition**

BindParameter (		
StatementHandle	IN	INTEGER,
ParameterNumber	IN	SMALLINT,
InputOutputMode	IN	SMALLINT,
ValueType	IN	SMALLINT,
ParameterType	IN	SMALLINT,
ColumnSize	IN	INTEGER,
DecimalDigits	IN	SMALLINT,
ParameterValue	DEF	ANY,
BufferLength	IN	INTEGER,
StrLen_or_Ind	DEF	INTEGER )
RETURNS SMALLINT		

### **General Rules**

- the full PDF of Isolitics of Is 1) Let *S* be the allocated SQL-statement identified by StatementHandle.
- 2) Let HV be the value of the handle of the current application parameter descriptor for S.
- 3) Let APD be the allocated CLI descriptor area identified by HV and let N2 be the value of the TOP\_LEVEL\_COUNT field of APD.
- 4) Let PN be the value of Parameter Number.
- 5) If PN is less than 1 (one), then an exception condition is raised: dynamic SOL error invalid descriptor index.
- Let *IOM* be the value of InputOutputMode.
- then an exception condition is raised: *CLI-specific condition* — *invalid parameter mode*.
- Let VT be the value of ValueType.
- 9) Let HL be the programming language of the invoking host program. Let operative data type correspondence table be the data type correspondence table for HL as specified in Subclause 5.20, "SQL/CLI data type correspondences". Refer to the two columns of the operative data type correspondence table as the SQL data type column and the host data type column.
- 10) If any of the following are true, then an exception condition is raised: CLI-specific condition invalid data type in application descriptor.
  - a) VT does not indicate DEFAULT and is not one of the code values in Table 8, "Codes used for application data types in SQL/CLI".

- b) VT is one of the code values in Table 8, "Codes used for application data types in SQL/CLI", but the row that contains the corresponding SQL data type in the SQL data type column of the operative data type correspondence table contains 'None' in the host data type column.
- 11) Let *PT* be the value of ParameterType.
- 12) If *PT* is not one of the code values in Table 33, "Codes used for concise data types", then an exception condition is raised: *CLI-specific condition invalid data type*.
- 13) Let *IPD* be the implementation parameter descriptor associated with *S* and let *NI* be the value of the TOP\_LEVEL\_COUNT field of *IPD*.
- 14) If PN is greater than N1, then

#### Case:

- a) If the memory requirements to manage the larger *IPD* cannot be satisfied, then an exception condition is raised: *CLI-specific condition memory allocation error*.
- b) Otherwise, the TOP\_LEVEL\_COUNT field of *IPD* is set to *PN* and the COUNT field of *APD* is incremented by 1 (one).
- 15) If PN is greater than N2, then

- a) If the memory requirements to manage the larger *APD* cannot be satisfied, then an exception condition is raised: *CLI-specific condition memory allocation error*.
- b) Otherwise, the TOP\_LEVEL\_COUNT field of *APD* is set to *PN* and the COUNT field of *APD* is incremented by 1 (one).
- 16) Let *IDA1* be the item descriptor area of *IPD* specified by *PN*.
- 17) Let *CS* be the value of ColumnSize, let *DD* be the value of DecimalDigits, and let *BL* be the value of BufferLength.
- 18) Case:
  - a) If PT is one of the values listed in Table 34, "Codes used with concise datetime data types in SQL/CLI", then:
    - i) The data type of the <dynamic parameter specification> described by *IDA1* is set to a code shown in the Data Type Code column of Table 34, "Codes used with concise datetime data types in SQL/CLI", indicating the concise data type code.
    - The datetime interval code of the <dynamic parameter specification> described by *IDA1* is set to a code shown in the Datetime Interval Code column in Table 34, "Codes used with concise datetime data types in SQL/CLI", indicating the concise data type code.
    - iii) The length (in positions) of the <dynamic parameter specification> described by *IDA1* is set to *CS*.
    - iv) Case:
      - 1) If the datetime interval code of the <dynamic parameter specification> indicates DATE, then the time fractional seconds precision of the <dynamic parameter specification> described by *IDA1* is set to zero.

#### ISO/IEC 9075-3:2016(E) 6.6 BindParameter

- Otherwise, the time fractional seconds precision of the <dynamic parameter specification> described by *IDA1* is set to *DD*.
- b) If PT is one of the values listed in Table 35, "Codes used with concise interval data types in SQL/CLI", then:
  - i) The data type of the <dynamic parameter specification> described by *IDA1* is set to a code shown in the Data Type Code column of Table 35, "Codes used with concise interval data types in SQL/CLI", indicating the concise data type code.
  - The datetime interval code of the  $\langle$ dynamic parameter specification $\rangle$  described by DAI is set ii) to a code shown in the Datetime Interval Code column in Table 35, "Codes use Dwith concise interval data types in SOL/CLI", indicating the concise data type code. Let DIC be that code.
  - The length (in positions) of the <dynamic parameter specification > described by IDA1 is set iii) to CS.
  - Let LS be 0 (zero). iv)
  - If IOM is PARAM MODE IN or PARAM MODE INOUT, Parameter Value is not a null pointer, v) and BL is greater than zero, then:
    - 1) Let PV be the value of Parameter Value.
    - 2) Let FC be the value of

```
SUBSTR ( PV FROM 1 FOR 1 )
```

- 3) If FC is <plus sign> or <minus sign>, then let LS be 1 (one).
- vi) Case:
  - If DIC indicates SECOND, DAY TO SECOND, HOUR TO SECOND, or MINUTE TO SECOND, then the interval fractional seconds precision of the <dynamic parameter specification described by IDA1 is set to DD. If DD is 0 (zero), then let DP be 0 (zero); otherwise, let *DP* be 1 (one).
  - Otherwise the interval fractional seconds precision of the <dynamic parameter specification> described by *IDA1* is set to zero.
- Case: vii)
  - \[
    \frac{\pmathfrak{H}^2DIC}{\pmathfrak{H}^2DIC}
    \]
    indicates YEAR TO MONTH, DAY TO HOUR, HOUR TO MINUTE or MINUTE
    \[
    \text{M}^2DIC}
    \]
    indicates YEAR TO MONTH, DAY TO HOUR, HOUR TO MINUTE
    \[
    \text{M}^2DIC}
    \]
    indicates YEAR TO MONTH, DAY TO HOUR, HOUR TO MINUTE
    \[
    \text{M}^2DIC}
    \]
    indicates YEAR TO MONTH, DAY TO HOUR, HOUR TO MINUTE
    \[
    \text{M}^2DIC}
    \]
    indicates YEAR TO MONTH, DAY TO HOUR, HOUR TO MINUTE
    \[
    \text{M}^2DIC}
    \]
    indicates YEAR TO MONTH, DAY TO HOUR, HOUR TO MINUTE
    \[
    \text{M}^2DIC}
    \]
    indicates YEAR TO MONTH, DAY TO HOUR, HOUR TO MINUTE
    \[
    \text{M}^2DIC}
    \]
    indicates YEAR TO MONTH, DAY TO HOUR, HOUR TO MINUTE
    \[
    \text{M}^2DIC}
    \]
    indicates YEAR TO MONTH, DAY TO HOUR, HOUR TO MINUTE
    \[
    \text{M}^2DIC}
    \]
    indicates YEAR TO MONTH, DAY TO HOUR, HOUR TO MINUTE
    \[
    \text{M}^2DIC}
    \]
    indicates YEAR TO MONTH, DAY TO HOUR, HOUR TO MINUTE
    \[
    \text{M}^2DIC}
    \]
    indicates YEAR TO MONTH, TO MONTH TO MONTH TO MINUTE
    \[
    \text{M}^2DIC}
    \]
    indicates YEAR TO MONTH TO MONTH TO MONTH TO MONTH TO MINUTE
    \[
    \text{M}^2DIC}
    \]
    indicates YEAR TO MONTH TO MONTH TO MONTH TO MONTH TO MINUTE
    \[
    \text{M}^2DIC}
    \]
    indicates YEAR TO MONTH TO M TO SECOND, then let *IL* be 3.
  - If DIC indicates DAY TO MINUTE or HOUR TO SECOND, then let IL be 6.
  - If DIC indicates DAY TO SECOND, then let IL be 9.
  - Otherwise, let *IL* be zero. 4)
- viii) Case:
  - If DIC indicates SECOND, DAY TO SECOND, HOUR TO SECOND, or MINUTE TO SECOND, then the interval leading field precision of the <dynamic parameter specification> described by *IDA1* is set to *CS-IL-DD-DP-LS*.

2) Otherwise, the interval leading field precision of the <dynamic parameter specification> described by *IDA1* is set to *CS-IL-LS*.

#### c) Otherwise:

- i) The data type of the <dynamic parameter specification> described by *IDA1* is set to *PT*.
- ii) If *PT* indicates a character string type, then the length (in characters) of the <dynamic parameter specification> described by *IDA1* is set to *CS*.
- iii) If PT indicates a numeric type, then the precision of the <dynamic parameter specification> described by IDA1 is set to CS.
- iv) If *PT* indicates a numeric type, then the scale of the <dynamic parameter specification> described by *IDA1* is set to *DD*.
- 19) Let *IDA2* be the item descriptor area of *APD* specified by *PN*.
- 20) If an exception condition is raised in any of the following General Rules, then:
  - a) The TYPE, LENGTH, PRECISION, and SCALE fields of *IDA1* are set to implementation-dependent values and the values of the TOP\_LEVEL\_COUNT and COUNT fields of *IPD* are unchanged.
  - b) The TYPE, DATA\_POINTER, INDICATOR\_POINTER, and OCTET\_LENGTH\_POINTER fields of *IDA2* are set to implementation-dependent values and the values of the TOP\_LEVEL\_COUNT and COUNT fields of *APD* are unchanged.
- 21) The parameter mode of the <dynamic parameter specification> described by *IDA2* is set to *IOM*.
- 22) The data type of the <dynamic parameter specification> described by *IDA2* is set to *VT*.
- 23) The address of the host variable that is to provide a value for the <dynamic parameter specification> value described by *IDA2* is set to the address of ParameterValue. If ParameterValue is a null pointer, then the address is set to 0 (zero).
- 24) The address of the <indicator variable> associated with the host variable addressed by the DATA\_POINTER field of *IDA2* is set to the address of StrLen\_or\_Ind.
- 25) The address of the host variable that is to define the length (in octets) of the <dynamic parameter specification> value described by *IDA2* is set to the address of StrLen\_or\_Ind.
- 26) If *IOM* is PARAM MODE OUT or PARAM MODE INOUT and *BL* is not greater than zero, then an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.
- 27) The length in octets of the <dynamic parameter specification> value described by *IDA2* is set to *BL*.
- 28) If *IOM* is PARAM MODE IN or PARAM MODE INOUT, Parameter Value is not a null pointer, and *BL* is greater than 0 (zero), then let *PV* be the value of the <dynamic parameter specification> value described by *IDA*2.
- 29) Restrictions on the differences allowed between *APD* and *IPD* are implementation-defined, except as specified in the General Rules of Subclause 5.10, "Implicit EXECUTE USING and OPEN USING clauses", Subclause 5.11, "Implicit CALL USING clause", and the General Rules of Subclause 6.49, "ParamData".

#### 6.7 Cancel

#### **Function**

Attempt to cancel execution of a CLI routine.

- Let S be the allocated SQL-statement identified by StatementHandle.

  2) Case:

  a) If there is a CLI routine concurrently operating on S. thank

  i) Let RN be the routine name of the ii) Let C be the all iii) Let C be the all iiii) Let EC be the established SQL-connection associated with C and let SS be the SQL-server iii) associated with EC.
  - SS is requested to cancel the execution of RN. iv)
  - If SS rejects the cancellation request, then an exception condition is raised: CLI-specific condition v) — server declined the cancellation request.
  - If SS accepts the cancellation request, then a completion condition is raised: successful complevi) tion.

Acceptance of the request does not guarantee that the execution of RN will be cancelled.

vii) If SS succeeds in canceling the execution of RN, then an exception condition is raised for RN: CLI-specific condition — operation canceled.

> NOTE 21 — Canceling the execution of RN does not destroy any diagnostic information already generated by its execution.

NOTE 22 — The method of passing control between concurrently operating programs is implementation-dependent.

- If there is a deferred parameter number associated with S, then:
  - i) The diagnostics area associated with S is emptied.
  - ii) The deferred parameter number is removed from association with *S*.
  - iii) Any statement source associated with S is removed from association with S.
- Otherwise:

- i) The diagnostics area associated with S is emptied.
- ii) A completion condition is raised: successful completion.

### 6.8 CloseCursor

#### **Function**

Close a cursor.

### **Definition**

```
CloseCursor (
StatementHandle IN INTEGER )
RETURNS SMALLINT
```

- 1) Let S be the allocated SQL-statement identified by StatementHandle.
- 2) If there is no executed statement associated with *S*, then an exception condition is raised: *CLI-specific condition* function sequence error.
- 3) Case:
  - a) If there is no open CLI cursor associated with *S*, then an exception condition is raised: *invalid cursor* state.
  - b) Otherwise:
    - i) Let *CR* be the CLI cursor associated with *S*. The General Rules of Subclause 15.4, "Effect of closing a cursor", in [ISO9075-2] are applied, with *CR* as *CURSOR* and DESTROY as *DISPOSITION*.
    - ii) Any fetched row associated with S is removed from association with S.

#### 6.9 **ColAttribute**

#### **Function**

Get a column attribute.

#### **Definition**

```
ColAttribute (
    StatementHandle IN INTEGER,
ColumnNumber IN SMALLINT,
FieldIdentifier IN SMALLINT,
    CharacterAttribute OUT CHARACTER(L),
    BufferLength IN SMALLINT,
                         OUT SMALLINT,
    StringLength
    NumericAttribute OUT INTEGER )
    RETURNS SMALLINT
```

of 15011EC 9015-3:2016 where L has a maximum value equal to the implementation-defined maximum length of a variable-length character string.

- 1) Let *S* be the allocated SQL-statement identified by StatementHandle.
- 2) If there is no prepared or executed statement associated with S, then an exception condition is raised: CLIspecific condition — function sequence error.
- 3) Let IRD be the implementation row descriptor associated with S and let N be the value of the TOP LEVEL COUNT field of IRD.
- 4) Let FI be the value of FieldIdentifier.
- 5) If FI is not one of the code values in Table 21, "Codes used for SQL/CLI descriptor fields", then an exception condition is raised: CLI-specific condition — invalid descriptor field identifier.
- 6) Let *CN* be the value of ColumnNumber.
- 7) Let TYPE be the value of the Type column in the row of Table 21, "Codes used for SQL/CLI descriptor fields", that contains FI.
- 8) Let FDT be the value of the Data Type column in the row of Table 6, "Fields in SQL/CLI row and parameter descriptor areas", whose Field column contains the value of the Field column in the row of Table 21, "Codes used for SOL/CLI descriptor fields", that contains FI.
- 9) If *TYPE* is 'ITEM', then:
  - a) If N is zero, then an exception condition is raised: dynamic SQL error prepared statement not a cursor specification.
  - b) If CN is less than 1 (one), then an exception condition is raised: dynamic SOL error invalid descriptor index.

#### ISO/IEC 9075-3:2016(E) 6.9 ColAttribute

- If CN is greater than N, then a completion condition is raised: no data.
- d) Let IDA be the item descriptor area of IRD specified by the CN-th descriptor area in IRD for which LEVEL is 0 (zero).
- e) Let DT and DIC be the values of the TYPE and DATETIME\_INTERVAL\_CODE fields, respectively, for *IDA*.
- 10) If TYPE is 'HEADER', then:
  - a) If CN is less than 1 (one), then an exception condition is raised: dynamic SQL error descriptor index.
  - b) If CN is greater than N, then a completion condition is raised: no data.
  - c) Let CN be 0 (zero).
- 11) Let DH be the handle that identifies IRD.
- 12) Let RI be the number of the descriptor record in IRD that is the CN-th descriptor area for which LEVEL is 0 (zero).

Case:

If FDT indicates character string, then let the information be retrieved from IRD by implicitly executing GetDescField as follows:

```
GetDescField ( DH, RI, FI,
               CharacterAttribute, BufferLength, StringLength)
```

b) Otherwise,

Case:

If FI indicates TYPE, then i)

- 1) If DT indicates a <datetime type>, then NumericAttribute is set to the concise code value corresponding to the datetime interval code value DIC as defined in Table 36, "Concise codes used with datetime data types in SQL/CLI".
- **If DT** indicates INTERVAL, then NumericAttribute is set to the concise code value corresponding to the datetime interval code value DIC as defined in Table 37, "Concise codes used with interval data types in SQL/CLI".
- Otherwise, NumericAttribute is set to DT.
- Otherwise, let the information be retrieved from IRD by implicitly executing GetDescField as follows:

```
GetDescField ( DH, RI, FI,
   NumericAttribute, BufferLength, StringLength )
```

## 6.10 ColumnPrivileges

#### **Function**

Return a result set that contains a list of the privileges held on the columns whose names adhere to the requested atasc atasc police of 1501/EC of pattern or patterns within a single specified table stored in the Information Schema of the connected data source.

#### **Definition**

```
ColumnPrivileges (
                                                             IN INTEGER,
          StatementHandle
         CatalogName IN CHARACTER(L1),
NameLength1 IN SMALLINT,
SchemaName IN CHARACTER(L2),
NameLength2 IN SMALLINT,
TableName IN CHARACTER(L3),
NameLength3 IN SMALLINT,
ColumnName IN CHARACTER(L4),
NameLength4 IN SMALLINT)
RETURNS SMALLINT
          RETURNS SMALLINT
```

where each of L1, L2, L3, and L4 has a maximum value equal to the implementation-defined maximum length of a variable-length character string.

- 1) Let S be the allocated SQL-statement identified by StatementHandle.
- 2) If an open CLI cursor is associated with S, then an exception condition is raised: *invalid cursor state*.
- 3) Let C be the allocated SQL-connection with which S is associated.
- Let EC be the established SQL-connection associated with C and let SS be the SQL-server on that connection.
- 5) Let *COLUMN\_PRIVILEGES\_QUERY* be a table, with the definition:

```
CREATE TABLE COLUMN_PRIVILEGES_QUERY (
             TABLE COLUMN_PRIVILEGES_QUERY (
TABLE_CAT CHARACTER VARYING(128),
TABLE_SCHEM CHARACTER VARYING(128) NOT NULL,
TABLE_NAME CHARACTER VARYING(128) NOT NULL,
COLUMN_NAME CHARACTER VARYING(128) NOT NULL,
GRANTOR CHARACTER VARYING(128),
GRANTEE CHARACTER VARYING(128) NOT NULL,
PRIVILEGE CHARACTER VARYING(128) NOT NULL,
IS_GRANTABLE CHARACTER VARYING(3))
```

- COLUMN\_PRIVILEGES\_QUERY contains a row for each privilege in SS's Information Schema COL-UMN PRIVILEGES view where:
  - a) Let SUP be the value of Supported that is returned by the execution of GetFeatureInfo with FeatureType = 'FEATURE' and FeatureId = 'C041' (corresponding to the feature "Information Schema metadata constrained by privileges").

# ISO/IEC 9075-3:2016(E) 6.10 ColumnPrivileges

- b) Case:
  - i) If the value of *SUP* is 1 (one), then *COLUMN\_PRIVILEGES\_QUERY* contains a row for each privilege in *SS*'s Information Schema COLUMN\_PRIVILEGES view.
  - ii) Otherwise, *COLUMN\_PRIVILEGES\_QUERY* contains a row for each privilege in *SS*'s Information Schema COLUMN\_PRIVILEGES view that meets implementation-defined authorization criteria.
- 7) For each row of COLUMN\_PRIVILEGES\_QUERY:
  - a) If the implementation does not support catalog names, then TABLE\_CAT is the null value, otherwise, the value of TABLE\_CAT in *COLUMN\_PRIVILEGES\_QUERY* is the value of the TABLE\_CATALOG column in the COLUMN\_PRIVILEGES view in the Information Schema.
  - b) The value of TABLE\_SCHEM in *COLUMN\_PRIVILEGES\_QUERY* is the value of the TABLE\_SCHEMA column in the COLUMN\_PRIVILEGES view.
  - c) The value of TABLE\_NAME in *COLUMN\_PRIVILEGES\_QUERY* is the value of the TABLE\_NAME column in the COLUMN\_PRIVILEGES view.
  - d) The value of COLUMN\_NAME in *COLUMN\_PRIVILEGES\_QUERY* is the value of the COL-UMN NAME column in the COLUMN PRIVILEGES view.
  - e) The value of GRANTOR in *COLUMN\_PRIVILEGES\_QUERY* is the value of the GRANTOR column in the COLUMN\_PRIVILEGES view.
  - f) The value of GRANTEE in *COLUMN\_PRIVILEGES\_QUERY* is the value of the GRANTEE column in the COLUMN PRIVILEGES view.
  - g) The value of PRIVILEGE in *COLUMN\_PRIVILEGES\_QUERY* is the value of the PRIVILEGE\_TYPE column in the COLUMN\_PRIVILEGES view.
  - h) The value of IS\_GRANTABLE in *COLUMN\_PRIVILEGES\_QUERY* is the value of the IS\_GRANTABLE column in the COLUMN\_PRIVILEGES view.
- 8) Let *NL1*, *NL2*, *NL3*, and *NL4* be the values of NameLength1, NameLength2, NameLength3, and NameLength4, respectively.
- 9) Let *CATVAL*, *SCHVAL*, *TBLVAL*, and *COLVAL* be the values of CatalogName, SchemaName, TableName, and ColumnName, respectively.
- 10) If the METADATA ID attribute of S is TRUE, then:
  - a) If CatalogName is a null pointer and the value of the CATALOG NAME information type from Table 29, "Codes and data types for implementation information", is 'Y', then an exception condition is raised: *CLI-specific condition*—invalid use of null pointer.
  - b) If SchemaName is a null pointer or if ColumnName is a null pointer, then an exception condition is raised: *CLI-specific condition invalid use of null pointer*.
- 11) If TableName is a null pointer, then an exception condition is raised: *CLI-specific condition invalid use of null pointer*.
- 12) If CatalogName is a null pointer, then *NL1* is set to zero. If SchemaName is a null pointer, then *NL2* is set to zero. If TableName is a null pointer, then *NL3* is set to zero. If ColumnName is a null pointer, then *NL4* is set to zero.

#### 13) Case:

- a) If NL1 is not negative, then let L be NL1.
- b) If *NL1* indicates NULL TERMINATED, then let *L* be the number of octets of CatalogName that precede the implementation-defined null character that terminates a C character string.
- c) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.

Let *CATVAL* be the first *L* octets of CatalogName.

#### 14) Case:

- a) If NL2 is not negative, then let L be NL2.
- b) If *NL2* indicates NULL TERMINATED, then let *L* be the number of octets of SchemaName that precede the implementation-defined null character that terminates a C character string.
- c) Otherwise, an exception condition is raised: *CLI-specific condition*—invalid string length or buffer length.

Let SCHVAL be the first L octets of SchemaName.

#### 15) Case:

- a) If NL3 is not negative, then let L be NL3.
- b) If *NL3* indicates NULL TERMINATED, then let *L* be the number of octets of TableName that precede the implementation-defined null character that terminates a C character string.
- c) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.

Let *TBLVAL* be the first *L* octets of TableName.

#### 16) Case:

- a) If NL4 is not negative, then let L be NL4.
- b) If *NL4* indicates **NULL** TERMINATED, then let *L* be the number of octets of ColumnName that precede the implementation-defined null character that terminates a C character string.
- c) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.

Let *COLVAL* be the first *L* octets of ColumnName.

#### 17) Case:

- a) If the METADATA ID attribute of *S* is TRUE, then:
  - i) Case:
    - 1) If the value of *NL1* is zero, then let *CATSTR* be a zero-length string.
    - 2) Otherwise,

# ISO/IEC 9075-3:2016(E) 6.10 ColumnPrivileges

ii)

iii)

```
A) If SUBSTRING(TRIM('CATVAL') FROM 1 FOR 1) = '"' and if SUB-
        STRING(TRIM('CATVAL') FROM CHAR_LENGTH(TRIM('CATVAL')) FOR 1)
        = '"', then let TEMPSTR be the value obtained from evaluating:
        SUBSTRING(TRIM('CATVAL') FROM 2
        FOR CHAR_LENGTH(TRIM('CATVAL')) - 2)
        and let CATSTR be the character string:
        TABLE_CAT = 'TEMPSTR' AND
    B) Otherwise, let CATSTR be the character string:
        UPPER(TABLE_CAT) = UPPER('CATVAL') AND
Case:
1) If the value of NL2 is zero, then let SCHSTR be a zero-length string.
   Otherwise,
    Case:
    A) If SUBSTRING(TRIM('SCHVAL') FROM 1 FOR 1) = '"' and if SUB-
        STRING(TRIM('SCHVAL') FROM CHAR_LENGTH(TRIM('SCHVAL')) FOR 1)
        = '"', then let TEMPSTR be the value obtained from evaluating:
        SUBSTRING(TRIM('SCHVAL') FROM 2
          FOR CHAR_LENGTH(TRIM (SCHVAL')) - 2)
        and let SCHSTR be the character string:
        TABLE SCHEM =
                       TEMPSTR' AND
       Otherwise, let SCHSTR be the character string:
        UPPER(TABLE_SCHEM) = UPPER('SCHVAL') AND
Case:
   If the value of NL3 is zero, then let TBLSTR be a zero-length string.
   Otherwise,
    A) If SUBSTRING(TRIM('TBLVAL') FROM 1 FOR 1) = '"' and if SUB-
        STRING(TRIM('TBLVAL')) FROM CHAR_LENGTH(TRIM('TBLVAL')) FOR 1)
        = '"', then let TEMPSTR be the value obtained from evaluating:
        SUBSTRING(TRIM('TBLVAL') FROM 2
          FOR CHAR_LENGTH(TRIM('TBLVAL')) - 2)
        and let TBLSTR be the character string:
```

TABLE\_NAME = 'TEMPSTR' AND

B) Otherwise, let *TBLSTR* be the character string:

```
UPPER(TABLE_NAME) = UPPER('TBLVAL') AND
```

- iv) Case:
  - 1) If the value of *NL4* is zero, then let *COLSTR* be a zero-length string.
  - 2) Otherwise,

Case:

A) If SUBSTRING(TRIM('COLVAL') FROM 1 FOR 1) = '"' and if SUBSTRING(TRIM('COLVAL') FROM CHAR\_LENGTH(TRIM('COLVAL')) FOR 1) = '"', then let TEMPSTR be the value obtained from evaluating:

SUBSTRING(TRIM('COLVAL') FROM 2
FOR CHAR\_LENGTH(TRIM('COLVAL')) - 2)
and let COLSTR be the character string:

```
COLUMN_NAME = 'TEMPSTR'
```

B) Otherwise, let *COLSTR* be the character string:

```
UPPER(COLUMN_NAME) = UPPER('GOLVAL')
```

- b) Otherwise,
  - i) Let *SPC* be the Code value from Table 29, "Codes and data types for implementation information", that corresponds to the Information Type SEARCH PATTERN ESCAPE in that same table.
  - ii) Let *ESC* be the value of InfoValue that is returned by the execution of GetInfo() with the value of InfoType set to *SPC*.
  - iii) If the value of *NLD* is zero, then let *CATSTR* be a zero-length string; otherwise, let *CATSTR* be the character string:

```
TABLE_CAT = 'CATVAL' AND
```

iv) If the value of *NL2* is zero, then let *SCHSTR* be a zero-length string; otherwise, let *SCHSTR* be the character string:

```
TABLE_SCHEM = 'SCHVAL' AND
```

V) If the value of *NL3* is zero, then let *TBLSTR* be a zero-length string; otherwise, let *TBLSTR* be the character string:

```
TABLE NAME = 'TBLVAL' AND
```

vi) If the value of *NL4* is zero, then let *COLSTR* be a zero-length string; otherwise, let *COLSTR* be the character string:

```
COLUMN_NAME LIKE 'COLVAL' ESCAPE 'ESC' AND
```

#### ISO/IEC 9075-3:2016(E) 6.10 ColumnPrivileges

18) Let *PRED* be the result of evaluating:

```
CATSTR || ' ' || SCHSTR || ' ' || TBLSTR || ' ' || COLSTR || ' ' || 1=1
```

19) Let *STMT* be the character string:

```
SELECT *
FROM COLUMN_PRIVILEGES_QUERY
WHERE PRED
ORDER BY TABLE_CAT, TABLE_SCHEM, TABLE_NAME, COLUMN_NAME, PRIVILEGE
```

ORDER BY TABLE\_CAT, TABLE\_SCHEM, TABLE\_NAME, COLUMN\_NAME, PRIVILEGE

20) ExecDirect is implicitly invoked with S as the value of StatementHandle, STMT as the value of Statement-Text, and the length of STMT as the value of TextLength.

#### 6.11 Columns

#### **Function**

Based on the specified selection criteria, return a result set that contains information about columns of tables PDF of 15011EC 9015.3:2016 stored in the information schemas of the connected data source.

#### **Definition**

```
Columns (
                          IN
                                    INTEGER,
    StatementHandle
                           IN
    CatalogName
                                    CHARACTER(L1),
                           IN
    NameLength1
                                    SMALLINT,
    SchemaName
                           IN
                                    CHARACTER(L2),
                  IN SMALLINT,
IN CHARACTER(L3),
IN SMALLINT,
IN CHARACTER(L4),
IN SMALLINT)
    NameLength2
    TableName
    NameLength3
    ColumnName
    NameLength4
    RETURNS SMALLINT
```

where each of L1, L2, L3, and L4 has a maximum value equal to the implementation-defined maximum length of a variable-length character string.

- 1) Let S be the allocated SQL-statement identified by StatementHandle.
- 2) If an open CLI cursor is associated with S, then an exception condition is raised: *invalid cursor state*.
- 3) Let C be the allocated SQL-connection with which S is associated.
- 4) Let EC be the established SQL-connection associated with C and let SS be the SQL-server on that connection.
- 5) Let *COLUMNS\_QUERY* be a table, with the definition:

```
CREATE TABLE COLUMNS_QUERY (
       EATE TABLE COLUMNS_QUERY (
TABLE_CAT CHARACTER VARYING(128),
TABLE_SCHEM CHARACTER VARYING(128) NOT NULL,
TABLE_NAME CHARACTER VARYING(128) NOT NULL,
COLUMN_NAME CHARACTER VARYING(128) NOT NULL,
DATA_TYPE SMALLINT NOT NULL,
TYPE_NAME CHARACTER VARYING(128) NOT NULL,
COLUMN_SIZE INTEGER,
BUFFER_LENGTH INTEGER,
DECIMAL_DIGITS SMALLINT,
NUM_PREC_RADIX SMALLINT,
NULLABLE SMALLINT NOT NULL,
            NULLABLE SMALLINT NOT NULL,
REMARKS CHARACTER VARYING(254),
COLUMN_DEF CHARACTER VARYING(254),
SQL_DATA_TYPE SMALLINT NOT NULL,
             SQL_DATETIME_SUB INTEGER,
             CHAR_OCTET_LENGTH INTEGER,
```

                     CHARACTER VARYING(128),
CHARACTER VARYING(128),
SCOPE_CAT CHARACTER VARYING(128),
SCOPE_SCHEM CHARACTER VARYING(128),
SCOPE_NAME CHARACTER VARYING(128),
                     CHARACTER VARYING(128),
MAX_CARDINALITY INTEGER,
DTD_IDENTIFIER CHARACTER VARYING(128),
IS_SELE_BEE CHARACTED_VARYING(128)
IS SELF REF
                      CHARACTER VARYING(128),
UNIQUE (TABLE_CAT, TABLE_SCHEM, TABLE_NAME, COLUMN_NAME)
```

- 6) COLUMNS\_QUERY contains a row for each column described by SS's Information Schema COLUMNS view where:
  - a) Let *SUP* be the value of Supported that is returned by the execution of GetFeatureInfo with FeatureType = 'FEATURE' and FeatureId = 'C041' (corresponding to the feature "Information Schema metadata constrained by privileges").
  - b) Case:
    - i) If the value of *SUP* is 1 (one), then *COLUMNS\_QUERY* contains a row for each row describing a column in *SS*'s Information Schema COLUMNS view.
    - ii) Otherwise, *COLUMNS\_QUERY* contains a row for each row describing a column in *SS*'s Information Schema COLUMNS view that meets implementation-defined authorization criteria.
- 7) For each row of *COLUMNS\_QUERY*:
  - a) The value of TABLE\_CAT in *COLUMNS\_QUERY* is the value of the TABLE\_CATALOG column in the COLUMNS view. If *SS* does not support catalog names, then TABLE\_CAT is set to the null value.
  - b) The value of TABLE\_SCHEM in *COLUMNS\_QUERY* is the value of the TABLE\_SCHEMA column in the COLUMNS view.
  - c) The value of TABLE\_NAME in *COLUMNS\_QUERY* is the value of the TABLE\_NAME column in the COLUMNS view.
  - d) The value of COLUMN\_NAME in *COLUMNS\_QUERY* is the value of the COLUMN\_NAME column in the COLUMNS view.
  - e) The value of DATA\_TYPE in *COLUMNS\_QUERY* is determined by the values of the DATA\_TYPE and INTERVAL\_TYPE columns in the COLUMNS view.

- i) If the value of DATA\_TYPE in the COLUMNS view is 'INTERVAL', then the value of DATA\_TYPE in *COLUMNS\_QUERY* is the appropriate 'Code' from Table 33, "Codes used for concise data types", that matches the interval specified in the INTERVAL\_TYPE column in the COLUMNS view.
- ii) Otherwise, the value of DATA\_TYPE in *COLUMNS\_QUERY* is the appropriate 'Code' from Table 33, "Codes used for concise data types", that matches the value specified in the DATA TYPE column in the COLUMNS view.
- f) The value of TYPE\_NAME in *COLUMNS\_QUERY* is an implementation-defined value that is the character string by which the data type is known at the data source.
- g) The value of COLUMN\_SIZE in COLUMNS\_QUERY is

#### Case:

- i) If the value of DATA\_TYPE in the COLUMNS view is 'CHARACTER', 'CHARACTER VARYING', 'CHARACTER LARGE OBJECT', 'BINARY', 'BINARY VARYING' or 'BINARY LARGE OBJECT', then the value is that of the CHARACTER\_MAXIMUM\_LENGTH in the same row of the COLUMNS view.
- ii) If the value of DATA\_TYPE in the COLUMNS view is 'DECIMAL' or 'NUMERIC', then the value is that of the NUMERIC\_PRECISION column in the same row of the COLUMNS view.
- iii) If the value of DATA\_TYPE in the COLUMNS view is 'SMALLINT', 'INTEGER', 'BIGINT', 'FLOAT', 'DECFLOAT', 'REAL', or 'DOUBLE PRECISION', then the value is implementation-defined.
- iv) If the value of DATA\_TYPE in the COLUMNS view is 'DATE', 'TIME', 'TIMESTAMP', 'TIME WITH TIME ZONE', or 'TIMESTAMP WITH TIME ZONE', then the value of COLUMN\_SIZE is that determined by SR 39), in Subclause 6.1, "<data type>", in [ISO9075-2], where the value of <time fractional seconds precision> is the value of the DATETIME\_PRECISION column in the same row of the COLUMNS view.
- v) If the value of DATA\_TYPE in the COLUMNS view is 'INTERVAL', then the value of COLUMN\_SIZE is that determined by the General Rules of Subclause 10.1, "<interval qualifier>", in [ISO9075-2], where:
  - 1) The value of <interval qualifier> is the value of the INTERVAL\_TYPE column in the same row of the COLUMNS view.
  - 2) The value of <interval leading field precision> is the value of the INTERVAL\_PRECISION column in the same row of the COLUMNS view.
  - 3) The value of <interval fractional seconds precision> is the value of the NUMERIC\_PRE-CISION column in the same row of the COLUMNS view.
- vi) If the value of DATA\_TYPE in the COLUMNS view is 'REF', then the value is the length in octets of the reference type.
- vii) Otherwise, the value is implementation-dependent.
- h) The value of BUFFER\_LENGTH in COLUMNS\_QUERY is implementation-defined.

NOTE 23 — The purpose of BUFFER\_LENGTH in *COLUMNS\_QUERY* is to record the number of octets transferred for the column with a Fetch routine, a FetchScroll routine, or a GetData routine when the TYPE field in the application row descriptor indicates DEFAULT. This length excludes any null terminator.

#### ISO/IEC 9075-3:2016(E) 6.11 Columns

i) The value of DECIMAL\_DIGITS in *COLUMNS\_QUERY* is

#### Case:

- i) If the value of DATA\_TYPE in the COLUMNS view is one of 'DATE', 'TIME', 'TIMESTAMP', 'TIME WITH TIME ZONE', or 'TIMESTAMP WITH TIME ZONE', then the value of DECIMAL\_DIGITS in *COLUMNS\_QUERY* is the value of the DATETIME\_PRECISION column in the COLUMNS view.
- ii) If the value of DATA\_TYPE in the COLUMNS view is one of 'NUMERIC', 'DECIMAL', 'SMALLINT', 'INTEGER', or 'BIGINT', then the value of DECIMAL\_DIGITS in COLUMNS\_QUERY is the value of the NUMERIC\_SCALE column in the COLUMNS view.
- iii) Otherwise, the value of DECIMAL\_DIGITS in *COLUMNS\_QUERY* is the null value.
- j) The value of NUM\_PREC\_RADIX in *COLUMNS\_QUERY* is the value of the NUMERIC\_PRECI-SION\_RADIX column in the COLUMNS view.
- k) If the value of the IS\_NULLABLE column in the COLUMNS view is 'NO', then the value of NULLABLE in COLUMNS\_QUERY is set to the appropriate 'Code' for NO NULLS in Table 27, "Miscellaneous codes used in CLI"; otherwise it is set to the appropriate 'Code' for NULLABLE from Table 27, "Miscellaneous codes used in CLI".
- 1) The value of REMARKS in *COLUMNS\_QUERY* is an implementation-defined description of the column.
- m) The value of COLUMN\_DEF in *COLUMNS\_QUERY* is the value of the COLUMN\_DEFAULT column in the COLUMNS view.
- n) The value of SQL\_DATETIME\_SUB in *COLUMNS\_QUERY* is determined by the value of the DATA\_TYPE column in the same row of the COLUMNS view.

- i) If the value of DATA\_TYPE in the COLUMNS view is the appropriate 'Code' for the any of the data types 'DATE', 'TIME', 'TIMESTAMP', 'TIME WITH TIME ZONE', or 'TIMESTAMP WITH TIME ZONE' from Table 33, "Codes used for concise data types", then the value is the matching 'Datetime Interval Code' from Table 34, "Codes used with concise datetime data types in SQL/CL!")
- ii) If the value of DATA\_TYPE in the COLUMNS view is the appropriate 'Code' for any of the INTERVAL data types from Table 33, "Codes used for concise data types", then the value is the matching 'Datetime Interval Code' from Table 35, "Codes used with concise interval data types in SQL/CLI".
- (ii) Otherwise, the value is the null value.
- o) The value of CHAR\_OCTET\_LENGTH in *COLUMNS\_QUERY* is the value of the CHARAC-TER OCTET LENGTH column in the COLUMNS view.
- p) The value of ORDINAL\_POSITION in *COLUMNS\_QUERY* is the value of the ORDINAL\_POSITION column in the COLUMNS view.
- q) The value of IS\_NULLABLE in *COLUMNS\_QUERY* is the value of the IS\_NULLABLE column in the COLUMNS view.

r) The value of SQL\_DATA\_TYPE in *COLUMNS\_QUERY* is determined by the value of the DATA\_TYPE column in the same row of the COLUMNS view.

- i) If the value of DATA\_TYPE in the COLUMNS view is the appropriate 'Code' for any of the data types 'DATE', 'TIME', 'TIMESTAMP', 'TIME WITH TIME ZONE', or 'TIMESTAMP WITH TIME ZONE', from Table 33, "Codes used for concise data types", then the value is the matching 'Code' from Table 7, "Codes used for implementation data types in SQL/CLC".
- ii) If the value of DATA\_TYPE in the COLUMNS view is the appropriate 'Code' for any of the INTERVAL data types from Table 33, "Codes used for concise data types", then the value is the matching 'Code' from Table 7, "Codes used for implementation data types in SQL/CLI".
- iii) Otherwise, the value is the same as the value of DATA\_TYPE in COLUMNS\_QUERY.
- s) The value of CHAR\_SET\_CAT in *COLUMNS\_QUERY* is the value of the CHARACTER\_SET\_CAT-ALOG column in the COLUMNS view. If *SS* does not support catalog names, then CHAR\_SET\_CAT is set to the null value.
- t) The value of CHAR\_SET\_SCHEM in *COLUMNS\_QUERY* is the value of the CHARAC-TER\_SET\_SCHEMA column in the COLUMNS view.
- u) The value of CHAR\_SET\_NAME in *COLUMNS\_QUERY* is the value of the CHARAC-TER\_SET\_NAME column in the COLUMNS view.
- v) The value of COLLATION\_CAT in *COLUMNS QUERY* is the value of the COLLATION\_CATALOG column in the COLUMNS view. If *SS* does not support catalog names, then COLLATION\_CAT is set to the null value.
- w) The value of COLLATION \_SCHEM in *COLUMNS\_QUERY* is the value of the COLLATION \_SCHEMA column in the COLUMNS view.
- x) The value of COLLATION\_NAME in *COLUMNS\_QUERY* is the value of the COLLATION\_NAME column in the COLUMNS view.
- y) The value of UDT\_CAT in *COLUMNS\_QUERY* is the value of the USER\_DEFINED\_TYPE\_CAT-ALOG column in the COLUMNS view. If *SS* does not support catalog names, then UDT\_CAT is set to the null value.
- z) The value of UDT\_SCHEM in *COLUMNS\_QUERY* is the value of the USER\_DEFINED\_TYPE\_SCHEMA column in the COLUMNS view.
- aa) The value of UDT\_NAME in *COLUMNS\_QUERY* is the value of the USER\_DEFINED\_TYPE\_NAME column in the COLUMNS view.
- ab) The value of DOMAIN\_CAT in COLUMNS\_QUERY is the value of the DOMAIN\_CATALOG column in the COLUMNS view. If SS does not support catalog names, then DOMAIN\_CAT is set to the null value.
- ac) The value of DOMAIN\_SCHEM in COLUMNS\_QUERY is the value of the DOMAIN\_SCHEMA column in the COLUMNS view.
- ad) The value of DOMAIN\_NAME in COLUMNS\_QUERY is the value of the DOMAIN\_NAME column in the COLUMNS view.

#### ISO/IEC 9075-3:2016(E) 6.11 Columns

- ae) The value of SCOPE\_CAT in COLUMNS\_QUERY is the value of the SCOPE\_CATALOG column in the COLUMNS view. If SS does not support catalog names, then SCOPE\_CAT is set to the null value.
- af) The value of SCOPE\_SCHEM in COLUMNS\_QUERY is the value of the SCOPE\_SCHEMA column in the COLUMNS view.
- ag) The value of SCOPE\_NAME in COLUMNS\_QUERY is the value of the SCOPE\_NAME column in the COLUMNS view.
- ah) The value of MAX\_CARDINALITY in COLUMNS\_QUERY is the value of the MAXIMUM\_CAR-DINALITY column in the COLUMNS view.
- ai) The value of DTD\_IDENTIFIER in COLUMNS\_QUERY is the value of the DTD\_IDENTIFIER column in the COLUMNS view.
- aj) The value of IS\_SELF\_REF in COLUMNS\_QUERY is the value of the IS\_SELF\_REFERENCING column in the COLUMNS view.
- 8) Let *NL1*, *NL2*, *NL3*, and *NL4* be the values of NameLength1, NameLength2, NameLength3, and NameLength4, respectively.
- 9) Let *CATVAL*, *SCHVAL*, *TBLVAL*, and *COLVAL* be the values of CatalogName, SchemaName, TableName, and ColumnName, respectively.
- 10) If the METADATA ID attribute of *S* is TRUE, then:
  - a) If CatalogName is a null pointer and the value of the CATALOG NAME information type from Table 29, "Codes and data types for implementation information", is 'Y', then an exception condition is raised: *CLI-specific condition invalid use of null pointer*.
  - b) If SchemaName is a null pointer, or if TableName is a null pointer, or if ColumnName is a null pointer, then an exception condition is raised: *CLI-specific condition invalid use of null pointer*.
- 11) If CatalogName is a null pointer, then *NL1* is set to zero. If SchemaName is a null pointer, then *NL2* is set to zero. If TableName is a null pointer, then *NL3* is set to zero. If ColumnName is a null pointer, then *NL4* is set to zero.
- 12) Case:
  - a) If *NL1* is not negative, then let *L* be *NL1*.
  - b) If *NL1* indicates NULL TERMINATED, then let *L* be the number of octets of CatalogName that precede the implementation-defined null character that terminates a C character string.
  - c) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.

Let *CATVAL* be the first *L* octets of CatalogName.

- 13) Case:
  - a) If *NL*2 is not negative, then let *L* be *NL*2.
  - b) If *NL2* indicates NULL TERMINATED, then let *L* be the number of octets of SchemaName that precede the implementation-defined null character that terminates a C character string.

c) Otherwise, an exception condition is raised: *CLI-specific condition* — *invalid string length or buffer length*.

Let *SCHVAL* be the first *L* octets of SchemaName.

#### 14) Case:

- a) If *NL3* is not negative, then let *L* be *NL3*.
- b) If *NL3* indicates NULL TERMINATED, then let *L* be the number of octets of TableName that precede the implementation-defined null character that terminates a C character string.
- c) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.

Let *TBLVAL* be the first *L* octets of TableName.

#### 15) Case:

- a) If *NL4* is not negative, then let *L* be *NL4*.
- b) If *NL4* indicates NULL TERMINATED, then let *L* be the number of octets of ColumnName that precede the implementation-defined null character that terminates a C character string.
- c) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.

Let *COLVAL* be the first *L* octets of ColumnName.

#### 16) Case:

- a) If the METADATA ID attribute of S is TRUE, then:
  - i) Case:
    - 1) If the value of *NL1* is zero, then let *CATSTR* be a zero-length string.
    - 2) Otherwise.

Case

A) If SUBSTRING(TRIM('CATVAL') FROM 1 FOR 1) = '"' and if SUBSTRING(TRIM('CATVAL') FROM CHAR\_LENGTH(TRIM('CATVAL')) FOR 1)
= '"', then let TEMPSTR be the value obtained from evaluating:

```
SUBSTRING ( TRIM('CATVAL') FROM 2
FOR CHAR_LENGTH ( TRIM('CATVAL') ) - 2 )
```

and let *CATSTR* be the character string:

```
TABLE_CAT = 'TEMPSTR' AND
```

B) Otherwise, let *CATSTR* be the character string:

```
UPPER(TABLE_CAT) = UPPER('CATVAL') AND
```

- ii) Case:
  - 1) If the value of *NL2* is zero, then let *SCHSTR* be a zero-length string.

#### ISO/IEC 9075-3:2016(E) 6.11 Columns

2) Otherwise,

Case:

A) If SUBSTRING(TRIM('SCHVAL') FROM 1 FOR 1) = '"' and if SUBSTRING(TRIM('SCHVAL') FROM CHAR\_LENGTH(TRIM('SCHVAL')) FOR 1)
= '"', then let TEMPSTR be the value obtained from evaluating:

```
SUBSTRING ( TRIM('SCHVAL') FROM 2
FOR CHAR_LENGTH ( TRIM('SCHVAL') ) - 2 )
and let SCHSTR be the character string:
```

TABLE\_SCHEM = 'TEMPSTR' AND

B) Otherwise, let *SCHSTR* be the character string:

```
UPPER(TABLE_SCHEM) = UPPER('SCHVAL') AND
```

- iii) Case:
  - 1) If the value of *NL3* is zero, then let *TBLSTR* be a zero-length string.
  - 2) Otherwise.

Case:

A) If SUBSTRING(TRIM('TBLVAL') FROM 1 FOR 1) = '"' and if SUBSTRING(TRIM('TBLVAL') FROM CHAR\_LENGTH(TRIM('TBLVAL')) FOR 1) = '"', then let TEMPSTR be the value obtained from evaluating:

SUBSTRING (TRIM('TBLVAL') FROM 2
FOR CHAR\_LENGTH (TRIM('TBLVAL')) - 2)

and let TBLSTR be the character string:

TABLE NAME = 'TEMPSTR' AND

B) Otherwise, let *TBLSTR* be the character string:

```
UPPER(TABLE_NAME) = UPPER('TBLVAL') AND
```

- iv) Case:
  - 1) If the value of *NL4* is zero, then let *COLSTR* be a zero-length string.
  - 2) Otherwise,

Case:

A) If SUBSTRING(TRIM('COLVAL') FROM 1 FOR 1) = '"' and if SUBSTRING(TRIM('COLVAL') FROM CHAR\_LENGTH(TRIM('COLVAL')) FOR 1)
= '"', then let TEMPSTR be the value obtained from evaluating:

```
SUBSTRING ( TRIM('COLVAL') FROM 2
FOR CHAR_LENGTH ( TRIM('COLVAL') ) - 2 )
and let COLSTR be the character string:

COLUMN_NAME = 'TEMPSTR'
```

B) Otherwise, let *COLSTR* be the character string:

```
UPPER(COLUMN NAME) = UPPER('COLVAL')
```

- b) Otherwise:
  - i) Let *SPC* be the Code value from Table 29, "Codes and data types for implementation information", that corresponds to the Information Type SEARCH PATTERN ESCAPE in that same table.
  - ii) Let *ESC* be the value of InfoValue that is returned by the execution of GetInfo() with the value of InfoType set to *SPC*.
  - iii) If the value of *NL1* is zero, then let *CATSTR* be a zero-length string; otherwise, let *CATSTR* be the character string:

```
TABLE CAT = 'CATVAL' AND
```

iv) If the value of *NL2* is zero, then let *SCHSTR* be a zero-length string; otherwise, let *SCHSTR* be the character string:

```
TABLE_SCHEM LIKE 'SCHVAL' ESCAPE 'ESC' AND
```

NOTE 24 — The pattern value specified in the string to the right of LIKE may use the escape character that is indicated by the value of the SEARCH PATTERN ESCAPE information type from Table 29, "Codes and data types for implementation information".

v) If the value of *NL3* is zero, then let *TBLSTR* be a zero-length string; otherwise, let *TBLSTR* be the character string:

```
TABLE NAME LIKE 'TBLVAL' ESCAPE 'ESC' AND
```

NOTE 25 — The pattern value specified in the string to the right of LIKE may use the escape character that is indicated by the value of the SEARCH PATTERN ESCAPE information type from Table 29, "Codes and data types for implementation information".

vi) If the value of *NL4* is zero, then let *COLSTR* be a zero-length string. Otherwise, let *COLSTR* be the character string:

```
COLUMN_NAME = 'COLVAL' AND
```

17) Let *PRED* be the result of evaluating:

```
CATSTR | | ' ' | | SCHSTR | | ' ' | | TBLSTR | | ' ' | | COLSTR | | ' ' | | 1=1
```

18) Let *STMT* be the character string:

```
SELECT *
```

#### ISO/IEC 9075-3:2016(E) 6.11 Columns

```
FROM COLUMNS_QUERY
WHERE PRED
ORDER BY TABLE_CAT, TABLE_SCHEM, TABLE_NAME, ORDINAL_POSITION
```

19) ExecDirect is implicitly invoked with S as the value of StatementHandle, STMT as the value of Statement-Text, and the length of *STMT* as the value of TextLength.

#### 6.12 Connect

#### **Function**

Establish a connection.

#### **Definition**

```
Connect (
   ConnectionHandle IN INTEGER,
                     IN CHARACTER(L1),
   ServerName
   NameLength1
                     IN SMALLINT,
   UserName
                     IN CHARACTER (L2).
   NameLength2
                     IN SMALLINT,
   Authentication IN CHARACTER(L3), NameLength3 IN SMALLINT)
   RETURNS SMALLINT
```

#### where:

- *L1* has a maximum value of 128.
- JIII PDF of ISOIIEC 9015.3:2016 hed — L2 has a maximum value equal to the implementation-defined maximum length of a variable-length character string.
- L3 and has an implementation-defined maximum value.

- 1) Case:
  - If ConnectionHandle does not identify an allocated SQL-connection, then an exception condition is raised: *CLI-specific condition* — invalid handle.
  - Otherwise:
    - Let C be the allocated SQL-connection identified by ConnectionHandle. i)
    - The diagnostics area associated with C is emptied. ii)
- 2) If an SQL-transaction is active for the current SQL-connection and the implementation does not support transactions that affect more than one SQL-server, then an exception condition is raised: feature not supported — multiple server transactions.
- 3) If there is an established SQL-connection associated with C, then an exception condition is raised: connection exception — connection name in use.
- 4) Case:
  - a) If ServerName is a null pointer, then let *NL1* be zero.
  - b) Otherwise, let *NL1* be the value of NameLength1.
- 5) Case:

#### ISO/IEC 9075-3:2016(E)

#### 6.12 Connect

- If *NL1* is not negative, then let *L1* be *NL1*.
- If NL1 indicates NULL TERMINATED, then let L1 be the number of octets of ServerName that precede the implementation-defined null character that terminates a C character string.
- c) Otherwise, an exception condition is raised: CLI-specific condition invalid string length or buffer length.

#### Case: 6)

- a) If L1 is zero, then let 'DEFAULT' be the value of SN.
- b) If *L1* is greater than 128, then an exception condition is raised: *CLI-specific condition* Atting of Isolike 901 length or buffer length.
- c) Otherwise, let SN be the first L1 octets of ServerName.
- 7) Let *E* be the allocated SQL-environment with which *C* is associated.
- 8) Case:
  - a) If UserName is a null pointer, then let *NL2* be zero.
  - b) Otherwise, let *NL2* be the value of NameLength2.
- 9) Case:
  - a) If NL2 is not negative, then let L2 be NL2.
  - If NL2 indicates NULL TERMINATED, then let L2 be the number of Octets of UserName that precede the implementation-defined null character that terminates a C character string.
  - c) Otherwise, an exception condition is residued: CLI-specific condition invalid string length or buffer length.
- 10) Case:
  - a) If Authentication is a null pointer, then let *NL3* be zero.
  - Otherwise, let *NL3* be the value of NameLength3.
- 11) Case:
  - If *NL3* is not negative, then let *L3* be *NL3*.
  - b) If NL3 indicates NULL TERMINATED, then let L3 be the number of octets of Authentication that precede the implementation-defined null character that terminates a C character string.
  - c) Otherwise, an exception condition is raised: CLI-specific condition invalid string length or buffer **length**.
- 12) Case:
  - a) If the value of SN is 'DEFAULT', then:
    - i) If L2 is not zero, then an exception condition is raised: CLI-specific condition — invalid string length or buffer length.
    - ii) If L3 is not zero, then an exception condition is raised: CLI-specific condition — invalid string length or buffer length.

iii) If an established default SQL-connection is associated with an allocated SQL-connection associated with *E*, then an exception condition is raised: *connection exception* — *connection name in use*.

#### b) Otherwise:

- i) If L2 is zero, then let UN be an implementation-defined <user identifier>.
- ii) If L2 is non-zero, then:
  - 1) Let UV be the first L2 octets of UserName and let UN be the result of

```
TRIM ( BOTH ' ' FROM 'UV' )
```

- 2) If *UN* does not conform to the Format and Syntax Rules of a <user identifier>, then an exception condition is raised: *invalid authorization specification*.
- 3) If *UN* does not conform to any implementation-defined restrictions on its value, then an exception condition is raised: *invalid authorization specification*.
- iii) Case:
  - 1) If L3 is not zero, then let AU be the first L3 octets of Authentication.
  - 2) Otherwise, let *AU* be an implementation-defined authentication string, whose length may be zero.

#### 13) Case:

- a) If the value of *SN* is 'DEFAULT', then the default SQL-session is initiated and associated with the default SQL-server. The method by which the default SQL-server is determined is implementation-defined.
- b) Otherwise, an SQL-session is initiated and associated with the SQL-server identified by SN. The method by which SN is used to determine the appropriate SQL-server is implementation-defined.
- 14) If an SQL-session is successfully initiated, then:
  - a) The current SQL-connection and current SQL-session, if any, become a *dormant SQL-connection* and a *dormant SQL-session* respectively. The SQL-session context information is preserved and is not affected in any way by operations performed over the initiated SQL-connection.

```
NOTE 26 The SQL-session context information is defined in Subclause 4.43, "SQL-sessions", in [ISO9075-2].
```

- b) The initiated SQL-session becomes the *current SQL-session* and the SQL-connection established to that SQL-session becomes the *current SQL-connection* and is associated with *C*.
  - NOTE 27 If an SQL-session is not successfully initiated, then the current SQL-connection and current SQL-session, if any, remain unchanged.
- 15) If the SQL-client cannot establish the SQL-connection, then an exception condition is raised: *connection exception SQL-client unable to establish SQL-connection*.
- 16) If the SQL-server rejects the establishment of the SQL-connection, then an exception condition is raised: connection exception SQL-server rejected establishment of SQL-connection.

NOTE 28 — AU and UN are used by the SQL-server, along with other implementation-dependent values, to determine whether to accept or reject the establishment of an SQL-session.

#### ISO/IEC 9075-3:2016(E) 6.12 Connect

- 17) The SQL-server for the subsequent execution of SQL-statements via CLI routine invocations is set to the SQL-server identified by SN.
- 18) The SOL-session user identifier and the current user identifier are set to UN. The current role name is set to the null value.

## 6.13 CopyDesc

#### **Function**

Copy a CLI descriptor.

### **Definition**

```
CopyDesc (
   SourceDescHandle
                                   INTEGER,
   TargetDescHandle
                        IN
                                   INTEGER )
   RETURNS SMALLINT
```

- 1) Case:
  - If SourceDescHandle does not identify an allocated CLI descriptor area, then an exception condition is raised: *CLI-specific condition* — *invalid handle*.
  - b) Otherwise, let SD be the CLI descriptor area identified by SourceDescHandle.
- 2) Case:
  - a) If TargetDescHandle does not identify an affocated CLI descriptor area, then an exception condition is raised: *CLI-specific condition* — invalid handle.
  - b) Otherwise:
    - Let TD be the CLI descriptor area identified by TargetDescHandle. i)
    - The diagnostics area associated with TD is emptied.
- 3) The General Rules of Subclause 5.16, "Deferred parameter check", are applied to SD as the DESCRIPTOR
- 4) The General Rules of Subclause 5.16, "Deferred parameter check", are applied to TD as the DESCRIPTOR AREA.
- 5) If TD is an implementation row descriptor, then an exception condition is raised: CLI-specific condition cannot modify an implementation row descriptor.
- Let AT be the value of the ALLOC\_TYPE field of TD.
- The contents of *TD* are replaced by a copy of the contents of *SD*. 7)
- The ALLOC\_TYPE field of *TD* is set to *AT*.

#### 6.14 DataSources

#### **Function**

Get server name(s) that the SQL/CLI application can connect to, along with description information, if available. of 15011EC 9015-3:2016

#### **Definition**

```
DataSources (
   EnvironmentHandle
                        TN
                                  INTEGER,
   Direction
                        IN
                                   SMALLINT,
   ServerName
                        OUT
                                   CHARACTER(L1),
   BufferLength1
                        TN
                                  SMALILINT.
   NameLength1
                        OUT
                                   SMALLINT,
                                   CHARACTER(L2),
   Description
                        OUT
   BufferLength2
                        IN
                                   SMALLINT,
                        OUT
                                   SMALLINT )
   NameLength2
   RETURNS SMALLINT
```

where L1 and L2 have maximum values equal to the implementation-defined maximum length of a variablelength character string.

- 1) Let *EH* be the value of EnvironmentHandle.
- If EH does not identify an allocated SQL-environment or if it identifies an allocated skeleton SQL-environment, then an exception condition is raised: *CLI-specific condition* — invalid handle.
- 3) Let E be the allocated SQL-environment identified by EH. The diagnostics area associated with E is emptied.
- 4) Let *BL1* and *BL2* be the values of BufferLength1 and BufferLength2, respectively.
- 5) Let *D* be the value of Direction.
- 6) If D is not either the code value for NEXT or the code value for FIRST in Table 25, "Codes used for fetch orientation", then an exception condition is raised: CLI-specific condition — invalid retrieval code.
- 7) Let  $SN_1$ ,  $SN_3$ , etc., be an ordered set of the names of SQL-servers to which the SQL/CLI application might be eligible to connect (where the mechanism used to establish this set is implementation-defined).
  - CNOTE  $29 SN_1$ ,  $SN_2$ ,  $SN_3$ , etc., are the names that an SQL/CLI application would use in invocations of Connect, rather than the "actual" names of the SQL-servers.
- 8) Let  $D_1$ ,  $D_2$ ,  $D_3$ , etc., be strings describing the SQL-servers named by  $SN_1$ ,  $SN_2$ ,  $SN_3$ , etc. (again provided via an implementation-defined mechanism).
- 9) Case:
  - a) If D indicates FIRST, or if DataSources has never been successfully called on EH, or if the previous call to DataSources on EH raised a completion condition: no data, then:

- i) If there are no entries in the set  $SN_1$ ,  $SN_2$ ,  $SN_3$ , etc., then a completion condition is raised: *no data* and no further rules for this Subclause are applied.
- ii) The General Rules of Subclause 5.14, "Character string retrieval", are applied with ServerName,  $SN_1$ , BL1, and NameLength1 as TARGET, VALUE, TARGET OCTET LENGTH, and RETURNED OCTET LENGTH, respectively.
- iii) The General Rules of Subclause 5.14, "Character string retrieval", are applied with Description,  $D_1$ , BL2, and NameLength2 as TARGET, VALUE, TARGET OCTET LENGTH, and RETURNED OCTET LENGTH, respectively.

#### b) Otherwise,

- i) Let  $SN_n$  be the ServerName value that was returned on the previous call to DataSources on EH.
- ii) If there is no entry in the set after  $SN_n$ , then a completion condition is raised: no data and no further rules for this subclause are applied.
- iii) The General Rules of Subclause 5.14, "Character string retrieval", are applied with ServerName,  $SN_{n+1}$ , BL1, and NameLength1 as TARGET, VALUE, TARGET OCTET LENGTH, and RETURNED OCTET LENGTH, respectively.
- The General Rules of Subclause 5.14, "Character string retrieval", are applied with Description,  $D_{n+1}$ , BL2, and NameLength2 as TARGET, VALUE, TARGET OCTET LENGTH, and RETURNED OCTET LENGTH, respectively.

  The General Rules of Subclause 5.14, "Character string retrieval", are applied with Description,  $D_{n+1}$ , BL2, and NameLength2 as TARGET OCTET LENGTH, and RETURNED OCTET LENGTH, respectively.

**SQL/CLI routines** 163

#### 6.15 DescribeCol

#### **Function**

Get column attributes.

#### **Definition**

DescribeCol (			٠,5,
StatementHandle	IN	INTEGER,	
ColumnNumber	IN	SMALLINT,	
ColumnName	OUT	$\mathtt{CHARACTER}(L)$ ,	·Ci
BufferLength	IN	SMALLINT,	
NameLength	OUT	SMALLINT,	
DataType	OUT	SMALLINT,	cO.
ColumnSize	OUT	INTEGER,	
DecimalDigits	OUT	SMALLINT,	
Nullable	OUT	SMALLINT )	
RETURNS SMALLINT			

where L has a maximum value equal to the implementation-defined maximum length of a variable-length character string.

- 1) Let S be the allocated SQL-statement identified by StatementHandle.
- 2) If there is no prepared or executed statement associated with *S*, then an exception condition is raised: *CLI*-specific condition function sequence error.
- 3) Let *IRD* be the implementation row descriptor associated with *S* and let *N* be the value of the TOP LEVEL COUNT field of *IRD*.
- 4) If N is zero, then an exception condition is raised: dynamic SQL error prepared statement not a cursor specification.
- 5) Let *CN* be the value of ColumnNumber.
- 6) If CN is less than 1 (one) or greater than N, then an exception condition is raised: dynamic SQL error—invalid descriptor index.
- 7) Let *RI* be the number of the descriptor record in *IRD* that is the *CN*-th descriptor area for which LEVEL is  $\theta$  (zero). Let *C* be the <select list> column described by the item descriptor area of *IRD* specified by *RI*.
- 8) Let *BL* be the value of BufferLength.
- 9) Information is retrieved from *IRD*:
  - a) Case:
    - i) If the data type of *C* is datetime, then DataType is set to the value of the Code column from Table 36, "Concise codes used with datetime data types in SQL/CLI", corresponding to the datetime interval code of *C*.

- ii) If the data type of *C* is interval, then DataType is set to the value of the Code column from Table 37, "Concise codes used with interval data types in SQL/CLI", corresponding to the datetime interval code of *C*.
- iii) Otherwise, DataType is set to the data type of C.

#### b) Case:

- i) If the data type of *C* is character string, then ColumnSize is set to the maximum length in octets of *C*.
- ii) If the data type of C is exact numeric or approximate numeric, then ColumnSize is set to the maximum length of C in decimal digits.
- iii) If the data type of C is datetime or interval, then ColumnSize is set to the length in positions of C.
- iv) If the data type of C is a reference type, then ColumnSize is set to the length in octets of that reference type.
- v) Otherwise, ColumnSize is set to an implementation-dependent value.

#### c) Case:

- i) If the data type of C is exact numeric, then DecimalDigits is set to the scale of C.
- ii) If the data type of *C* is datetime, then Decimal Digits is set to the time fractional seconds precision of *C*.
- iii) If the data type of *C* is interval, then DecimalDigits is set to the interval fractional seconds precision of *C*.
- iv) Otherwise, DecimalDigits is set to an implementation-dependent value.
- d) If C is known not null, then Nullable is set to 1 (one); otherwise, Nullable is set to 0 (zero).
- e) The name associated with C is retrieved. If C has an implementation-dependent name, then the value retrieved is the implementation-dependent name for C; otherwise, the value retrieved is the <derived column> name of C. Let V be the value retrieved. The General Rules of Subclause 5.14, "Character string retrieval", are applied with ColumnName, V, BL, and NameLength as TARGET, VALUE, TARGET OCTET LENGTH, and RETURNED OCTET LENGTH, respectively.

#### 6.16 Disconnect

#### **Function**

Terminate an established connection.

### **Definition**

```
Disconnect (
    ConnectionHandle IN INTEGER )
    RETURNS SMALLINT
```

#### **General Rules**

- 1) Case:
  - a) If ConnectionHandle does not identify an allocated SQL-connection, then an exception condition is raised: *CLI-specific condition invalid handle*.
  - b) Otherwise:
    - i) Let C be the allocated SQL-connection identified by ConnectionHandle.
    - ii) The diagnostics area associated with this emptied.
- 2) Case:
  - a) If there is no established SQL-connection associated with *C*, then an exception condition is raised: *connection exception connection does not exist*.
  - b) Otherwise, let EC be the established SQL-connection associated with C.
- 3) Let *L1* be a list of the allocated SQL-statements associated with *C*. Let *L2* be a list of the allocated CLI descriptor areas associated with *C*.
- 4) If EC is active, then

- a) If any allocated SQL-statement in *L1* has a deferred parameter number associated with it, then an exception condition is raised: *CLI-specific condition* function sequence error.
- b) Otherwise, an exception condition is raised: invalid transaction state active SQL-transaction.
- 5) For every allocated SQL-statement AS in L1:
  - a) Let SH be the StatementHandle that identifies AS.
  - b) FreeHandle is implicitly invoked with HandleType indicating STATEMENT HANDLE and with *SH* as the value of Handle.
    - NOTE 30 Any diagnostic information generated by the invocation is associated with C and not with AS.
- 6) For every allocated CLI descriptor area AD in L2:

- a) Let *DH* be the DescriptorHandle that identifies *AD*.
- b) FreeHandle is implicitly invoked with HandleType indicating DESCRIPTOR HANDLE and with DH as the value of Handle.
  - NOTE 31 Any diagnostic information generated by the invocation is associated with C and not with AD.
- 7) Let *CC* be the current SQL-connection.
- 8) The SQL-session associated with EC is terminated. EC is terminated, regardless of any exception conditions that might occur during the disconnection process, and is no longer associated with C.
- 9) If any error is detected during the disconnection process, then a completion condition is raised: warning — disconnect error.
- STANDARDS SO. COM. Click to view the full Policy of the Control of 10) If EC and CC were the same SQL-connection, then there is no current SQL-connection. Otherwise, CC

#### 6.17 EndTran

#### **Function**

Terminate an SQL-transaction.

### **Definition**

```
EndTran (
HandleType IN SMALLINT,
Handle IN INTEGER,
CompletionType IN SMALLINT)
RETURNS SMALLINT
```

#### **General Rules**

- 1) Let HT be the value of Handle Type and let H be the value of Handle.
- 2) If HT is not one of the code values in Table 14, "Codes used for SQL/CLI handle types", then an exception condition is raised: CLI-specific condition invalid handle.
- 3) Case:
  - a) If HT indicates STATEMENT HANDLE, then

Case:

- i) If *H* does not identify an allocated SQL-statement, then an exception condition is raised: *CLI*-specific condition invalid handle.
- ii) Otherwise, an exception condition is raised: *CLI-specific condition*—invalid attribute identifier.
- b) If HT indicates DESCRIPTOR HANDLE, then

Case:

- i) If *H* does not identify an allocated CLI descriptor area, then an exception condition is raised: *CLI specific condition invalid handle*.
- ii) Otherwise, an exception condition is raised: *CLI-specific condition invalid attribute identifier*.
- c) If HT indicates CONNECTION HANDLE, then

- i) If *H* does not identify an allocated SQL-connection, then an exception condition is raised: *CLI*-specific condition invalid handle.
- ii) Otherwise:
  - 1) Let C be the allocated SQL-connection identified by H.
  - 2) The diagnostics area associated with C is emptied.

- 3) If C has an associated established SQL-connection that is active, then let L1 be a list containing C; otherwise, let L1 be an empty list.
- d) If HT indicates ENVIRONMENT HANDLE, then

#### Case:

- i) If *H* does not identify an allocated SQL-environment or if it identifies an allocated SQL-environment that is a skeleton SQL-environment, then an exception condition is raised: *CLI specific condition invalid handle*.
- ii) Otherwise:
  - 1) Let *E* be the allocated SQL-environment identified by *H*.
  - 2) The diagnostics area associated with E is emptied.
  - 3) Let *L* be a list of the allocated SQL-connections associated with *E*. Let *L1* be a list of the allocated SQL-connections in *L* that have an associated established SQL-connection that is active.
- 4) Let *CT* be the value of CompletionType.
- 5) If CT is not one of the code values in Table 15, "Codes used for transaction termination", then an exception condition is raised: CLI-specific condition invalid transaction operation code.
- 6) If L1 is empty, then no further rules of this Subclause are applied.
- 7) If the current SQL-transaction is part of an encompassing transaction that is controlled by an agent other than the SQL-agent, then an exception condition is raised: *invalid transaction termination*.
- 8) Let L2 be a list of the allocated SQL-statements associated with allocated SQL-connections in L1.
- 9) If any of the allocated SQL-statements in L2 has an associated deferred parameter number, then an exception condition is raised: CLI-specific condition function sequence error.
- 10) Let L3 be a list of the open CL cursors associated with allocated SOL-statements in L2.
- 11) If CT indicates COMMIT COMMIT AND CHAIN, ROLLBACK, or ROLLBACK AND CHAIN, then:
  - a) Case:
    - i) If CT indicates COMMIT or COMMIT AND CHAIN, then let LOC be the list of all non-holdable cursors in L3.
    - ii) Otherwise, let *LOC* be the list of all cursors in *L3*.
  - b) For OC ranging over all CLI cursors in LOC:
    - 1) Let S be the allocated SOL-statement with which OC is associated.
    - ii) The General Rules of Subclause 15.4, "Effect of closing a cursor", in [ISO9075-2] are applied, with *OC* as *CURSOR* and DESTROY" as *DISPOSITION*.
    - iii) Any fetched row associated with S is removed from association with S.
- 12) If CT indicates COMMIT or COMMIT AND CHAIN, then:

#### ISO/IEC 9075-3:2016(E) 6.17 EndTran

- a) If an atomic execution context is active, then an exception condition is raised: *invalid transaction termination*.
- b) For every temporary table associated with the current SQL-transaction that specifies the ON COMMIT DELETE option and that was updated by the current SQL-transaction, the invocation of EndTran with *CT* indicating COMMIT is effectively preceded by the execution of a <delete statement: searched> that specifies DELETE FROM *T*, where *T* is the of that temporary table.
- c) The effects specified in the General Rules of Subclause 17.4, "<set constraints mode statement>", in [ISO9075-2], occur as if the statement SET CONSTRAINTS ALL IMMEDIATE were executed.
- d) Case:
  - i) If any constraint is not satisfied, then any changes to SQL-data or schemas that were made by the current SQL-transaction are canceled and an exception condition is raised: *transaction rollback integrity constraint violation*.
  - ii) If the execution of any <triggered SQL statement> is unsuccessful, then all changes to SQL-data or schemas that were made by the current SQL-transaction are cancelled and an exception condition is raised: transaction rollback triggered action exception.
  - iii) If any other error preventing commitment of the SQL-transaction has occurred, then any changes to SQL-data or schemas that were made by the current SQL-transaction are canceled and an exception condition is raised: *transaction rollback* with an implementation-defined subclass value.
  - iv) Otherwise, any changes to SQL-data or schemas that were made by the current SQL-transaction are made accessible to all concurrent and subsequent SQL-transactions.
- e) Every savepoint established in the current SQL-transaction is destroyed.
- f) Every valid non-holdable locator value is marked invalid.
- g) The current SQL-transaction is terminated. If CT indicates COMMIT AND CHAIN, then a new SQL-transaction is initiated with the same access mode and isolation level as the SQL-transaction just terminated. Any branch transactions of the SQL-transaction are initiated with the same access mode and isolation level as the corresponding branch of the SQL-transaction just terminated.
- 13) If *CT* indicates SAVEPOINT NAME RELEASE, then:
  - a) If HT is not CONNECTION HANDLE, then an exception condition is raised: CLI-specific condition—invalid handle.
  - b) Let SP be the value of the SAVEPOINT NAME connection attribute of C.
  - c) If SP does not specify a savepoint established within the current SQL-transaction, then an exception condition is raised: savepoint exception invalid specification.
  - d) The savepoint identified by SP and all savepoints established by the current SQL-transaction subsequent to the establishment of SP are destroyed.
- 14) If CT indicates ROLLBACK or ROLLBACK AND CHAIN, then:
  - a) If an atomic execution context is active, then an exception condition is raised: *invalid transaction termination*.
  - b) All changes to SQL-data or schemas that were made by the current SQL-transaction are canceled.

- c) Every savepoint established in the current SQL-transaction is destroyed.
- d) Every valid locator value is marked invalid.
- e) The current SQL-transaction is terminated. If CT indicates ROLLBACK AND CHAIN, then a new SQL-transaction is initiated with the same access mode and isolation level as the SQL-transaction just terminated. Any branch transactions of the SQL-transaction are initiated with the same access mode and isolation level as the corresponding branch of the SQL-transaction just terminated.
- 15) If CT indicates SAVEPOINT NAME ROLLBACK, then:
  - a) If HT is not CONNECTION HANDLE, then an exception condition is raised: CLI-specific condition—invalid handle.
  - b) Let SP be the value of the SAVEPOINT NAME connection attribute of C.
  - c) If SP does not specify a savepoint established within the current SQL-transaction, then an exception condition is raised: savepoint exception invalid specification.
  - d) If an atomic execution context is active and *SP* specifies a savepoint established before the beginning of the most recent atomic execution context, then an exception condition is raised: *savepoint exception invalid specification*.
  - e) Any changes to SQL-data or schemas that were made by the current SQL-transaction subsequent to the establishment of *SP* are canceled.
  - f) All savepoints established by the current SQL-transaction subsequent to the establishment of *SP* are destroyed.
  - g) Every valid locator that was generated in the current SQL-transaction subsequent to the establishment of *SP* is marked invalid.
  - h) For every open CLI cursor *OC* in  $\triangle$  that was opened subsequent to the establishment of *SP*:
    - i) Let S be the allocated SQL-statement with which OC is associated.
    - ii) The General Rules of Subclause 15.4, "Effect of closing a cursor", in [ISO9075-2] are applied, with *CR* as *CURSOR* and DESTROY as *DISPOSITION*.
    - iii) Any fetched row associated with OC is removed from association with S.
  - i) The status of any open CLI cursors in L3 that were opened by the current SQL-transaction before the establishment of SP is implementation-defined.

NOTE 32 — The current SQL-transaction is not terminated, and there is no other effect on the SQL-data or schemas.

#### **6.18** Error

### **Function**

Return diagnostic information.

## **Definition**

```
Error (

EnvironmentHandle IN INTEGER,
ConnectionHandle IN INTEGER,
StatementHandle IN INTEGER,
Sqlstate OUT CHARACTER(5),
NativeError OUT INTEGER,
MessageText OUT CHARACTER(L),
BufferLength IN SMALLINT,
TextLength OUT SMALLINT)
RETURNS SMALLINT
```

where L has a maximum value equal to the implementation-defined maximum length of a variable-length character string.

- 1) Case:
  - a) If StatementHandle identifies an allocated SQL-statement, then let *IH* be the value of StatementHandle and let *HT* be the code value for STATEMENT HANDLE from Table 14, "Codes used for SQL/CLI handle types".
  - b) If StatementHandle is zero and ConnectionHandle identifies an allocated SQL-connection, then let *IH* be the value of ConnectionHandle and let *HT* be the code value for CONNECTION HANDLE from Table 14, "Codes used for SQL/CLI handle types".
  - c) If ConnectionHandle is zero and EnvironmentHandle identifies an allocated SQL-environment, then let *IH* be the value of EnvironmentHandle and let *HT* be the code value for ENVIRONMENT HANDLE from Table 14, "Codes used for SQL/CLI handle types".
  - d) Otherwise, an exception condition is raised: *CLI-specific condition* invalid handle.
- 2) Let *R* be the most recently executed CLI routine, other than Error, GetDiagField, or GetDiagRec, for which *IH* was passed as a value of an input handle.
  - NOTE 33 The GetDiagField, GetDiagRec and Error routines may cause exception or completion conditions to be raised, but they do not cause status records to be generated.
- 3) Let *N* be the number of status records generated by the execution of *R*. Let *AP* be the number of status records generated by the execution of *R* already processed by Error. If *N* is zero or *AP* equals *N* then a completion condition is raised: *no data*, Sqlstate is set to '00000', the values of NativeError, MessageText, and TextLength are set to implementation-dependent values, and no further rules of this Subclause are applied.

4) Let SR be the first status record generated by the execution of R not yet processed by Error. Let RN be the number of the status record SR. Information is retrieved by implicitly executing GetDiagRec as follows:

```
GetDiagRec (HT, IH, RN, Sqlstate,
 NativeError, MessageText, BufferLength, TextLength)
```

5) Add SR to the list of status records generated by the execution of R already processed by Error.

# 6.19 ExecDirect

# **Function**

Execute a statement directly.

## **Definition**

```
ExecDirect (
   StatementHandle IN INTEGER,
   StatementText IN CHARACTER(L),
   TextLength IN INTEGER )
   RETURNS SMALLINT
```

where L has a maximum value equal to the implementation-defined maximum length of a variable-length character string.

- 1) Let S be the allocated SQL-statement identified by StatementHandle.
- 2) Let *TL* be the value of TextLength.
- 3) Let ST be the value of StatementText.
- 4) The General Rules of Subclause 5.4, "Preparing a statement", are applied, with *S* as *ALLOCATED STATEMENT*, *TL* as *TEXT LENGTH*, *ST* as *STATEMENT TEXT*, and "ExecDirect" as *INVOKER*.
- 5) The General Rules of Subclause 5.5. Executing a statement", are applied, with *S* as *ALLOCATED STATEMENT*, *P* as *PREPARED STATEMENT*, and "ExecDirect" as *INVOKER*.

# 6.20 Execute

# **Function**

Execute a prepared statement.

#### **Definition**

```
Execute (
   StatementHandle IN INTEGER )
   RETURNS SMALLINT
```

- 1) Let S be the allocated SQL-statement identified by StatementHandle.
- 2) If there is no prepared statement associated with S, then an exception condition is raised: CLI-specific condition — function sequence error. Otherwise, let P be the statement that was prepared.
- 3) If an open CLI cursor is associated with S, then an exception condition is raised: *invalid cursor state*.
- 4) The General Rules of Subclause 5.5, "Executing a statement", are applied, with S as ALLOCATED STATEMENT, P as PREPARED STATEMENT, and "Execute" as INVOKER.

# **6.21** Fetch

# **Function**

Fetch the next rowset of a CLI cursor.

# **Definition**

```
Fetch (
   StatementHandle
                       IN
                                INTEGER )
   RETURNS SMALLINT
```

- 1) Let S be the allocated SQL-statement identified by StatementHandle.
- 501EC 9015-3:2016 STANDARDSISO.COM. Citck to view the full standards of the 2) The General Rules of Subclause 5.12, "Fetching a rowset", are applied with S as ALLOCATED STATEMENT, NEXT as FETCH ORIENTATION, and 1 (one) as FETCH OFFSET.

# 6.22 FetchScroll

# **Function**

Position a CLI cursor on the specified rowset and retrieve values from that rowset.

```
Seneral Rules

1) Let S be the allocated SQL-statement identified by StatementHandle.

2) Let FO be the value of FetchOrientation.

3) Let OS be the value of Subclause 5.12, "For FO as FETCH ORIENTATION"
```

- 4) The General Rules of Subclause 5.12, "Fetching a rowset", are applied with *S* as *ALLOCATED STATEMENT*,

# 6.23 ForeignKeys

# **Function**

Return a result set that contains information about foreign keys either in or referencing a single specified table stored in the Information Schema of the connected data source. The result set contains information about either:

- The primary key of a single specified table together with the foreign keys in all other tables that reference that primary key.
- The foreign keys of a single specified table together with the primary or unique keys to which they refer.

# **Definition**

```
ForeignKeys (
                          IN
                                   INTEGER.
   StatementHandle
                           TN
                                   CHARACTER(L1),
   PKCatalogName
                           IN
                                   SMALLINT,
   NameLength1
                                   CHARACTER(L2),
   PKSchemaName
                           IN
   NameLength2
                           IN
                                   SMALLINT,
   PKTableName
                           IN
                                   CHARACTER (L3)
                           IN
                                   SMALLINT,
   NameLength3
                                   CHARACTER (L4)
   FKCatalogName
                           IN
   NameLength4
                           IN
                                   SMALLINT,
   FKSchemaName
                           IN
                                   CHARACTER (L5),
   NameLength5
                           IN
                                   SMALLINT,
   FKTableName
                           IN
                                   CHARACTER (L6),
                                   SMALLINT )
   NameLength6
                           IN
   RETURNS SMALLINT
```

where each of *L1*, *L2*, *L3*, *L4*, *L5*, and *L6* has a maximum value equal to the implementation-defined maximum length of a variable-length character string.

- 1) Let S be the allocated SQL-statement identified by StatementHandle.
- 2) If an open CL leursor is associated with S, then an exception condition is raised: *invalid cursor state*.
- 3) Let C be the allocated SQL-connection with which S is associated.
- 4) Let ECbe the established SQL-connection associated with C and let SS be the SQL-server on that connection.
- 5) Let *FOREIGN\_KEYS\_QUERY* be a table, with the definition:

```
FK_COLUMN_NAME CHARACTER VARYING(128) NOT NULL,
ORDINAL_POSITION SMALLINT NOT NULL,
UPDATE_RULE SMALLINT,
DELETE_RULE SMALLINT,
FK_NAME CHARACTER VARYING(128),
UK_NAME CHARACTER VARYING(128),
DEFERABILITY SMALLINT,
UNIQUE_OR_PRIMARY CHARACTER(7))
```

- 6) Let *PKN* and *FKN* be the value of PKTableName and FKTableName, respectively.
- 7) Case:
  - a) If CHAR\_LENGTH(PKN) = 0 (zero) and CHAR\_LENGTH(FKN)  $\neq$  0 (zero), then the result set returned describes all the foreign keys (if any) of the specified table, and describes the primary or unique keys to which they refer.
    - i) Let *FKS* represent the set of rows formed by a natural inner join on the values in the CON-STRAINT\_CATALOG, CONSTRAINT\_SCHEMA, and CONSTRAINT\_NAME columns between the rows in *SS*'s Information Schema REFERENTIAL\_CONSTRAINTS view and the matching rows in *SS*'s Information Schema TABLE CONSTRAINTS view.
    - ii) Let *UK* represent the row in *SS*'s Information Schema TABLE\_CONSTRAINTS view that defines the primary or unique key referenced by an individual foreign key in *FKS*. This row is obtained by matching the values in the UNIQUE\_CONSTRAINT\_CATALOG, UNIQUE\_CONSTRAINT\_SCHEMA, and UNIQUE\_CONSTRAINT\_NAME columns in a row of *FKS* to the values in the CONSTRAINT\_CATALOG, CONSTRAINT\_SCHEMA, and CONSTRAINT\_NAME columns in TABLE\_CONSTRAINTS.
    - iii) Let *FK\_COLS* represent the set of rows in *SS*'s Information Schema KEY\_COLUMN\_USAGE view that define the columns within an individual foreign key row in *FKS*.
    - iv) Let FKS COLS represent the set of rows in the combination of all FK COLS sets.
    - v) Let *UK\_COLS* represent the set of rows in *SS*'s Information Schema KEY\_COLUMN\_USAGE view that define the columns within an individual *UK*.
    - vi) Let UKS COLS represent the set of rows in the combination of all UK COLS sets.
    - vii) Let XKS\_COLS represent the set of extended rows formed by the inner equijoin of FKS\_COLS and UKS\_COLS matching CONSTRAINT\_CATALOG, CONSTRAINT\_SCHEMA, CONSTRAINT\_NAME, and POSITION\_IN\_UNIQUE\_CONSTRAINT in FKS\_COLS with CONSTRAINT\_CATALOG, CONSTRAINT\_SCHEMA, CONSTRAINT\_NAME, and ORDINAL\_POSITION in UKS\_COLS, respectively.
      - Let  $FKS\_COLS\_NAME$  be the name of each column of  $FKS\_COLS$  considered in turn; the names of the columns of  $XKS\_COLS$  originating from  $FKS\_COLS$  are respectively 'F\_' | |  $FKS\_COLS\_NAME$ .
      - Let  $UKS\_COLS\_NAME$  be the name of each column of  $UKS\_COLS$  considered in turn; the names of the columns of  $XKS\_COLS$  originating from  $UKS\_COLS$  are respectively 'U\_' | |  $UKS\_COLS\_NAME$ .
    - viii) FOREIGN\_KEYS\_QUERY contains a row for each row in XKS\_COLS where:

# ISO/IEC 9075-3:2016(E) 6.23 ForeignKeys

- 1) Let *SUP* be the value of Supported that is returned by the execution of GetFeatureInfo with FeatureType = 'FEATURE' and FeatureId = 'C041' (corresponding to the feature "Information Schema metadata constrained by privileges").
- 2) Case:
  - A) If the value of *SUP* is 1 (one), then *FOREIGN\_KEYS\_QUERY* contains a row for each column of all the foreign keys within a specific table in *SS*'s Information Schema TABLE\_CONSTRAINTS view.
  - B) Otherwise, *FOREIGN\_KEYS\_QUERY* contains a row for each column of all the foreign keys within a specific table in *SS*'s Information Schema TABLE\_CONSTRAINTS view in accordance with implementation-defined authorization criteria.
- ix) For each row of *FOREIGN\_KEYS\_QUERY*:
  - 1) If the implementation does not support catalog names, then UK\_TABLE\_CAT is set to the null value; otherwise, the value of UK\_TABLE\_CAT in FOREIGN\_KEYS\_QUERY is the value of the U\_TABLE\_CATALOG column in XKS\_COLS.
  - 2) The value of UK\_TABLE\_SCHEM in *FOREIGN\_KEYS\_QUERY* is the value of the U\_TABLE\_SCHEMA column in *XKS\_COLS*.
  - 3) The value of UK\_TABLE\_NAME in *FOREION\_KEYS\_QUERY* is the value of the U\_TABLE\_NAME column in *XKS\_COLS*.
  - 4) The value of UK\_COLUMN\_NAME in *FOREIGN\_KEYS\_QUERY* is the value of the U\_COLUMN\_NAME column in *XKS\_COLS*.
  - 5) If the implementation does not support catalog names, then UK\_TABLE\_CAT is set to the null value; otherwise, the value of FK\_TABLE\_CAT in FOREIGN\_KEYS\_QUERY is the value of the F\_TABLE\_CATALOG column in XKS\_COLS.
  - 6) The value of FK\_TABLE\_SCHEM in *FOREIGN\_KEYS\_QUERY* is the value of the F\_TABLE\_SCHEMA column in *XKS\_COLS*.
  - 7) The value of FK\_TABLE\_NAME in FOREIGN\_KEYS\_QUERY is the value of the F\_TABLE\_NAME column in XKS\_COLS.
  - 8) The value of FK\_COLUMN\_NAME in FOREIGN\_KEYS\_QUERY is the value of the E\_COLUMN\_NAME column in XKS\_COLS.
  - The value of ORDINAL\_POSITION in *FOREIGN\_KEYS\_QUERY* is the value of the F\_ORDINAL\_POSITION column in *XKS\_COLS*.
  - 10) The value of UPDATE\_RULE in *FOREIGN\_KEYS\_QUERY* is determined by the value of the UPDATE\_RULE column in *XKS\_COLS* as follows:
    - A) Let *UR* be the value in the UPDATE\_RULE column.
    - B) If *UR* is 'CASCADE', then the value of UPDATE\_RULE is the code for CASCADE in Table 27, "Miscellaneous codes used in CLI".
    - C) If *UR* is 'RESTRICT', then the value of UPDATE\_RULE is the code for RESTRICT in Table 27, "Miscellaneous codes used in CLI".

- D) If *UR* is 'SET NULL', then the value of UPDATE\_RULE is the code for SET NULL in Table 27, "Miscellaneous codes used in CLI".
- E) If *UR* is 'NO ACTION', then the value of UPDATE\_RULE is the code for NO ACTION in Table 27, "Miscellaneous codes used in CLI".
- F) If *UR* is 'SET DEFAULT', then the value of UPDATE\_RULE is the code for SET DEFAULT in Table 27, "Miscellaneous codes used in CLI".
- 11) The value of DELETE\_RULE in *FOREIGN\_KEYS\_QUERY* is determined by the value of the DELETE\_RULE column in *XKS\_COLS* as follows:
  - A) Let *DR* be the value in the DELETE\_RULE column.
  - B) If *DR* is 'CASCADE', then the value of DELETE\_RULE is the code for CASCADE in Table 27, "Miscellaneous codes used in CLI".
  - C) If *DR* is 'RESTRICT', then the value of DELETE\_RULE is the code for RESTRICT in Table 27, "Miscellaneous codes used in CLI".
  - D) If *DR* is 'SET NULL', then the value of DELETE RULE is the code for SET NULL in Table 27, "Miscellaneous codes used in CLI".
  - E) If *DR* is 'NO ACTION', then the value of DELETE\_RULE is the code for NO ACTION in Table 27, "Miscellaneous codes used in CLI".
  - F) If *DR* is 'SET DEFAULT', then the value of DELETE\_RULE is the code for SET DEFAULT in Table 27, "Miscellaneous codes used in CLI".
- 12) The value of FK\_NAME in *FOREIGN\_KEYS\_QUERY* is the value of the CON-STRAINT\_NAME column in *XKS\_COLS*.
- 13) The value of UK\_NAME in *FOREIGN\_KEYS\_QUERY* is the value of the UNIQUE\_CONSTRAINT\_NAME column in *XKS\_COLS*.
- 14) If there are no implementation-defined mechanisms for setting the value of DEFERABIL-ITY in FOREIGN\_KEYS\_QUERY to the value of the code for INITIALLY DEFERRED or to the value of the code for INITIALLY IMMEDIATE in Table 27, "Miscellaneous codes used in CLI", then the value of DEFERABILITY in FOREIGN\_KEYS\_QUERY is the code for NOT DEFERABLE in Table 27, "Miscellaneous codes used in CLI"; otherwise, the value of DEFERABILITY in FOREIGN\_KEYS\_QUERY can be the code for INITIALLY DEFERRED, the value of the code for INITIALLY IMMEDIATE, or the code for NOT DEFERRABLE in Table 27, "Miscellaneous codes used in CLI".
- 15) The value of UNIQUE\_OR\_PRIMARY in *FOREIGN\_KEYS\_QUERY* is 'UNIQUE' if the foreign key references a UNIQUE key and 'PRIMARY' if the foreign key references a primary key.
- x) Let *NL1*, *NL2*, and *NL3* be the values of NameLength4, NameLength5, and NameLength6, respectively.
- xi) Let *CATVAL*, *SCHVAL*, and *TBLVAL* be the values of FKCatalogName, FKSchemaName, and FKTableName, respectively.
- xii) If the METADATA ID attribute of S is TRUE, then:

### ISO/IEC 9075-3:2016(E) 6.23 ForeignKeys

- If FKCatalogName is a null pointer and the value of the CATALOG NAME information type from Table 29, "Codes and data types for implementation information", Y, then an exception condition is raised: *CLI-specific condition* — invalid use of null pointer.
- If FKSchemaName is a null pointer or if FKTableName is a null pointer, then an exception condition is raised: *CLI-specific condition* — *invalid use of null pointer*.
- If FKCatalogName is a null pointer, then NL1 is set to zero. If FKSchemaName is a null pointer, xiii) then NL2 is set to zero. If FKTableName is a null pointer, then NL3 is set to zero.
- Case: xiv)
  - 1) If NL1 is not negative, then let L be NL1.
  - 2) If NL1 indicates NULL TERMINATED, then let L be the number of octets of FKCatalog-Name that precede the implementation-defined null character that terminates a C character string.
  - 3) Otherwise, an exception condition is raised: CLI-specific condition invalid string length or buffer length.

Let CATVAL be the first L octets of FKCatalogName.

- Case: xv)
  - 1) If NL2 is not negative, then let L be NL2
  - If NL2 indicates NULL TERMINATED, then let L be the number of octets of FKSchemaName that precede the implementation-defined null character that terminates a C character
  - 3) Otherwise, an exception condition is raised: *CLI-specific condition* invalid string length or buffer length.

Let SCHVAL be the first Loctets of FKSchemaName.

- xvi) Case:
  - If *NL3* is hot negative, then let *L* be *NL3*.
  - If NL3 indicates NULL TERMINATED, then let L be the number of octets of FKTableName that precede the implementation-defined null character that terminates a C character string.
  - Otherwise, an exception condition is raised: CLI-specific condition invalid string length or buffer length.

Let *TBLVAL* be the first *L* octets of FKTableName.

- Case:
  - If the METADATA ID attribute of S is TRUE, then:
    - A) Case:
      - I) If the value of *NL1* is zero, then let *CATSTR* be a zero-length string.
      - II) Otherwise,

Case:

1) If SUBSTRING(TRIM('CATVAL') FROM 1 FOR 1) = '"' and if
 SUBSTRING(TRIM('CATVAL') FROM CHAR\_LENGTH(TRIM('CATVAL')) FOR 1) = '"', then let TEMPSTR be the value obtained from
 evaluating:

```
SUBSTRING(TRIM('CATVAL') FROM 2
FOR CHAR LENGTH(TRIM('CATVAL')) - 2)
```

and let *CATSTR* be the character string:

```
FK_TABLE_CAT = 'TEMPSTR' AND
```

2) Otherwise, let *CATSTR* be the character string:

```
UPPER(FK_TABLE_CAT) = UPPER('CATVAL') AN
```

- B) Case:
  - I) If the value of *NL2* is zero, then let *SCHSTR* be a zero-length string.
  - II) Otherwise,

Case:

1) If SUBSTRING(TRIM('SCHVAL') FROM 1 FOR 1) = '"' and if
 SUBSTRING(TRIM('SCHVAL') FROM
 CHAR\_LENGTH(TRIM('SCHVAL')) FOR 1) = '"', then let TEMPSTR
 be the value obtained from evaluating:

```
SUBSTRING(TRIM('SCHVAL')) FROM 2
FOR CHAR_LENGTH(TRIM('SCHVAL')) - 2)
```

and let *SCHSTR* be the character string:

```
FK_TABLE_SCHEM = 'TEMPSTR' AND
```

Otherwise, let *SCHSTR* be the character string:

```
UPPER(FK_TABLE_SCHEM) = UPPER('SCHVAL') AND
```

Case

- I) If the value of *NL3* is zero, then let *TBLSTR* be a zero-length string.
- II) Otherwise,

Case:

1) If SUBSTRING(TRIM('TBLVAL') FROM 1 FOR 1) = '"' and if
 SUBSTRING(TRIM('TBLVAL') FROM
 CHAR\_LENGTH(TRIM('TBLVAL')) FOR 1) = '"', then let TEMPSTR
 be the value obtained from evaluating:

```
SUBSTRING(TRIM('TBLVAL') FROM 2
FOR CHAR_LENGTH(TRIM('TBLVAL')) - 2)
and let TBLSTR be the character string:

FK_TABLE_NAME = 'TEMPSTR' AND
```

2) Otherwise, let *TBLSTR* be the character string:

```
UPPER(FK TABLE NAME) = UPPER('TBLVAL') AND
```

- 2) Otherwise:
  - A) If the value of *NL1* is zero, then let *CATSTR* be a zero-length string; otherwise, let *CATSTR* be the character string:

```
FK_TABLE_CAT = 'CATVAL' AND
```

B) If the value of *NL2* is zero, then let *SCHSTR* be a zero-length string; otherwise, let *SCHSTR* be the character string:

```
FK_TABLE_SCHEM = 'SCHVAL' AND
```

C) If the value of *NL3* is zero, then let *TBLSTR* be a zero-length string; otherwise, let *TBLSTR* be the character string:

```
FK TABLE NAME = 'TBLVAL'ANI
```

xviii) Let *PRED* be the result of evaluating:

```
CATSTR | ' ' | | SCHSTR | | ' ' | | TBLSTR | | ' ' | | 1=1
```

xix) Let STMT be the character string:

```
SELECT *

FROM FOREIGN_KEYS_QUERY

WHERE PRED

ORDER BY FK_TABLE_CAT, FK_TABLE_SCHEM, FK_TABLE_NAME, ORDINAL_POSITION
```

- Exercise implicitly invoked with S as the value of StatementHandle, STMT as the value of StatementText, and the length of STMT as the value of TextLength.
- b) If CHAR\_LENGTH(PKN)  $\neq$  0 (zero) and CHAR\_LENGTH(FKN) = 0 (zero), then the result set returned contains a description of the primary key (if any) of the specified table together with the descriptions of foreign keys in all other tables that reference that primary key.
  - i) Let *PKS* represent the set of rows in *SS*'s Information Schema TABLE\_CONSTRAINTS view where the value of CONSTRAINT\_TYPE is 'PRIMARY KEY'.
  - ii) Let *X* represent the set of rows formed by a natural inner join on the values in the CON-STRAINT\_CATALOG, CONSTRAINT\_SCHEMA, and CONSTRAINT\_NAME columns between the rows in *SS*'s Information Schema REFERENTIAL\_CONSTRAINTS view and the matching rows in *SS*'s Information Schema TABLE CONSTRAINTS view.

- iii) Let *FKS* represent the rows defining the foreign keys that reference an individual primary key in *PKS*. These rows are obtained by matching the values of CONSTRAINT\_CATALOG, CONSTRAINT\_SCHEMA, and CONSTRAINT\_NAME columns in a row of *PKS* to the values in the UNIQUE\_CONSTRAINT\_CATALOG, UNIQUE\_CONSTRAINT\_SCHEMA, and UNIQUE CONSTRAINT NAME columns in *X*.
- iv) Let FKSS represent the set of rows in the combination of all FKS sets.
- v) Let *PK\_COLS* represent the set of rows in *SS*'s Information Schema KEY\_COLUMN\_USAGE view that define the columns within an individual primary key row in *PKS*.
- vi) Let PKS\_COLS represent the set of rows in the combination of all PK\_COLS sets.
- vii) Let *FK\_COLS* represent the set of rows in *SS*'s Information Schema KEY\_COLUMN\_USAGE view that define the columns within an individual foreign key in *FKSS*.
- viii) Let FKS\_COLS represent the set of rows in the combination of all FK\_COLS sets.
- ix) Let XKS\_COLS represent the set of extended rows formed by the inner equijoin of PKS\_COLS and UKS\_COLS matching CONSTRAINT\_CATALOG, CONSTRAINT\_SCHEMA, CONSTRAINT\_NAME, and ORDINAL\_POSITION of PKS\_COLS with CONSTRAINT\_CATALOG, CONSTRAINT\_SCHEMA, CONSTRAINT\_NAME, and POSITION\_IN\_UNIQUE\_CONSTRAINT of FKS\_COLS, respectively.

Let  $PKS\_COLS\_NAME$  be the name of each column of  $PKS\_COLS$  considered in turn; the names of the columns of  $XKS\_COLS$  originating from  $PKS\_COLS$  are respectively 'P\_' | |  $UKS\_COLS\_NAME$ .

Let *FKS\_COLS\_NAME* be the name of each column of *FKS\_COLS* considered in turn; the names of the columns of *XKS\_COLS* originating from *FKS\_COLS* are respectively 'F\_' | | *FKS\_COLS\_NAME*.

- x) FOREIGN\_KEYS\_QUERY contains a row for each row in XKS\_COLS where:
  - 1) Let *SUP* be the value of Supported that is returned by the execution of GetFeatureInfo with FeatureType = 'FEATURE' and FeatureId = 'C041' (corresponding to the feature "Information Schema metadata constrained by privileges").
  - 2) Case:

If the value of *SUP* is 1 (one), then *FOREIGN\_KEYS\_QUERY* contains one or more rows describing the foreign keys that reference the primary key of a specific table in *SS*'s Information Schema TABLE\_CONSTRAINTS view.

- B) Otherwise, *FOREIGN\_KEYS\_QUERY* contains a row for each column of all the foreign keys that reference the primary key of a specific table in *SS*'s Information Schema TABLE\_CONSTRAINTS view in accordance with implementation-defined authorization criteria.
- xi) For each row of *FOREIGN\_KEYS\_QUERY*:
  - 1) If the implementation does not support catalog names, then UK\_TABLE\_CAT is set to the null value; otherwise, the value of UK\_TABLE\_CAT in FOREIGN\_KEYS\_QUERY is the value of the P\_TABLE\_CATALOG column in XKS\_COLS.
  - 2) The value of UK\_TABLE\_SCHEM in *FOREIGN\_KEYS\_QUERY* is the value of the P\_TABLE\_SCHEMA column in *XKS\_COLS*.

#### ISO/IEC 9075-3:2016(E) 6.23 ForeignKeys

- 3) The value of UK\_TABLE\_NAME in FOREIGN\_KEYS\_QUERY is the value of the P TABLE NAME column in XKS COLS.
- The value of UK COLUMN NAME in FOREIGN KEYS OUERY is the value of the P\_COLUMN\_NAME column in XKS\_COLS.
- If the implementation does not support catalog names, then UK\_TABLE\_CAT is set to the null value; otherwise, the value of UK\_TABLE\_CAT in FOREIGN\_KEYS\_QUERY is the value of the F\_TABLE\_CATALOG column in XKS\_COLS.
- The value of FK TABLE SCHEM in FOREIGN KEYS OUERY is the value of the F\_TABLE\_SCHEMA column in XKS\_COLS.
- 7) The value of FK\_TABLE\_NAME in FOREIGN\_KEYS\_QUERY is the value of the F\_TABLE\_NAME column in *XKS\_COLS*.
- 8) The value of FK\_COLUMN\_NAME in FOREIGN\_KEYS\_QUERY is the value of the F COLUMN NAME column in XKS COLS.
- 9) The value of ORDINAL\_POSITION in *FOREIGN\_KEXS\_QUERY* is the value of the F\_ORDINAL\_POSITION column in XKS\_COLS.
- 10) The value of UPDATE\_RULE in FOREIGN\_KEYS\_QUERY is determined by the value of the UPDATE\_RULE column in XKS\_CQLS as follows.
  - A) Let *UR* be the value in the UPDATE RULE column.
  - B) If UR is 'CASCADE', then the value of UPDATE RULE is the code for CASCADE in Table 27, "Miscellaneous codes used in CLI".
  - C) If UR is 'RESTRICT', then the value of UPDATE\_RULE is the code for RESTRICT in Table 27, "Miscellaneous codes used in CLI".
  - D) If UR is 'SET NULL', then the value of UPDATE\_RULE is the code for SET NULL in Table 27, "Miscellaneous codes used in CLI".
  - E) If UR is 'NO ACTION', then the value of UPDATE\_RULE is the code for NO ACTION in Table 27, "Miscellaneous codes used in CLI".
  - If UR is 'SET DEFAULT', then the value of UPDATE\_RULE is the code for SET CPEFAULT in Table 27, "Miscellaneous codes used in CLI".
- 1 10 The value of DELETE\_RULE in FOREIGN\_KEYS\_QUERY is determined by the value of the DELETE\_RULE column in XKS COLS.
  - A) Let *DR* be the value in the DELETE\_RULE column.
  - B) If DR is 'CASCADE', then the value of DELETE RULE is the code for CASCADE in Table 27, "Miscellaneous codes used in CLI".
  - C) If DR is 'RESTRICT', then the value of DELETE\_RULE is the code for RESTRICT in Table 27, "Miscellaneous codes used in CLI".
  - D) If DR is 'SET NULL', then the value of DELETE RULE is the code for SET NULL in Table 27, "Miscellaneous codes used in CLI".
  - E) If DR is 'NO ACTION', then the value of DELETE RULE is the code for NO ACTION in Table 27, "Miscellaneous codes used in CLI".

- F) If *DR* is 'SET DEFAULT', then the value of DELETE\_RULE is the code for SET DEFAULT in Table 27, "Miscellaneous codes used in CLI".
- 12) The value of FK\_NAME in *FOREIGN\_KEYS\_QUERY* is the value of the CON-STRAINT\_NAME column in *XKS\_COLS*.
- 13) The value of UK\_NAME in *FOREIGN\_KEYS\_QUERY* is the value of the UNIQUE\_CONSTRAINT\_NAME column in *XKS\_COLS*.
- 14) If there are no implementation-defined mechanisms for setting the value of DEFERABIL-ITY in FOREIGN\_KEYS\_QUERY to the value of the code for INITIALLY DEFERRED or to the value of the code for INITIALLY IMMEDIATE in Table 27, "Misoellaneous codes used in CLI", then the value of DEFERABILITY in FOREIGN\_KEYS\_QUERY is the code for NOT DEFERABLE in Table 27, "Miscellaneous codes used in CLI"; otherwise, the value of DEFERABILITY in FOREIGN\_KEYS\_QUERY can be the code for INITIALLY DEFERRED, the value of the code for INITIALLY IMMEDIATE, or the code for NOT DEFERRABLE in Table 27, "Miscellaneous codes used in CLI".
- 15) The value of UNIQUE\_OR\_PRIMARY in FOREIGN\_KEYS\_QUERY is 'PRIMARY'.
- xii) Let *NL1*, *NL2*, and *NL3* be the values of NameLength1, NameLength2, and NameLength3, respectively.
- xiii) Let *CATVAL*, *SCHVAL*, and *TBLVAL* be the values of PKCatalogName, PKSchemaName, and PKTableName, respectively.
- xiv) If the METADATA ID attribute of S is TRUE, then:
  - 1) If PKCatalogName is a null pointer and the value of the CATALOG NAME information type from Table 29, "Codes and data types for implementation information", *Y*, then an exception condition is raised. *CLI-specific condition invalid use of null pointer*.
  - 2) If PKSchemaName is a null pointer or if PKTableName is a null pointer, then an exception condition is raised: *CLI-specific condition invalid use of null pointer*.
- xv) If PKCatalogName is a null pointer, then *NL1* is set to zero. If PKSchemaName is a null pointer, then *NL2* is set to zero. If PKTableName is a null pointer, then *NL3* is set to zero.
- xvi) Case:
  - 1) If *NL1* is not negative, then let *L* be *NL1*.
  - Name that precede the implementation-defined null character that terminates a C character string.
  - 3) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.

Let *CATVAL* be the first *L* octets of PKCatalogName.

- xvii) Case:
  - 1) If *NL2* is not negative, then let *L* be *NL2*.

# ISO/IEC 9075-3:2016(E) 6.23 ForeignKeys

- 2) If *NL2* indicates NULL TERMINATED, then let *L* be the number of octets of PKSchemaName that precede the implementation-defined null character that terminates a C character string.
- 3) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.

Let SCHVAL be the first L octets of PKSchemaName.

#### xviii) Case:

- 1) If *NL3* is not negative, then let *L* be *NL3*.
- 2) If *NL3* indicates NULL TERMINATED, then let *L* be the number of octets of PKTableName that precede the implementation-defined null character that terminates a C character string.
- 3) Otherwise, an exception condition is raised: *CLI-specific condition*—invalid string length or buffer length.

Let *TBLVAL* be the first *L* octets of PKTableName.

#### xix) Case:

- 1) If the METADATA ID attribute of S is TRUE then:
  - A) Case:
    - I) If the value of *NL1* is zero, then let *CATSTR* be a zero-length string.
    - II) Otherwise,

Case:

1) If SUBSTRING(TRIM('CATVAL') FROM 1 FOR 1) = '"' and if SUBSTRING(TRIM('CATVAL') FROM CHAR\_LENGTH(TRIM('CAT-VAL')) FOR 1) = '"', then let TEMPSTR be the value obtained from evaluating:

```
SUBSTRING ( TRIM('CATVAL') FROM 2
FOR CHAR_LENGTH ( TRIM('CATVAL') ) - 2 )
```

and let *CATSTR* be the character string:

```
FK_TABLE_CAT = 'TEMPSTR' AND
```

2) Otherwise, let *CATSTR* be the character string:

```
UPPER(FK_TABLE_CAT) = UPPER('CATVAL') AND
```

- B) Case:
  - I) If the value of *NL2* is zero, then let *SCHSTR* be a zero-length string.
  - II) Otherwise,

Case:

1) If SUBSTRING(TRIM('SCHVAL') FROM 1 FOR 1) = '"' and if
 SUBSTRING(TRIM('SCHVAL') FROM
 CHAR\_LENGTH(TRIM('SCHVAL')) FOR 1) = '"', then let TEMPSTR
 be the value obtained from evaluating:

```
SUBSTRING ( TRIM('SCHVAL') FROM 2
FOR CHAR_LENGTH ( TRIM('SCHVAL') ) - 2 )
```

and let SCHSTR be the character string:

```
FK_TABLE_SCHEM = 'TEMPSTR' AND
```

2) Otherwise, let *SCHSTR* be the character string:

```
UPPER(FK TABLE SCHEM) = UPPER('SCHVAL') AN
```

- C) Case:
  - I) If the value of *NL3* is zero, then let *TBLSTR* be a zero-length string.
  - II) Otherwise,

Case:

1) If SUBSTRING(TRIM('TBLVAL') FROM 1 FOR 1) = '"' and if
 SUBSTRING(TRIM('TBLVAL') FROM
 CHAR\_LENGTH(TRIM('TBLVAL')) FOR 1) = '"', then let TEMPSTR
 be the value obtained from evaluating:

```
SUBSTRING TRIM('TBLVAL') FROM 2
FOR CHAR_LENGTH ( TRIM('TBLVAL') ) - 2 )
```

and let TBLSTR be the character string:

```
FK_TABLE_NAME = 'TEMPSTR' AND
```

Otherwise, let *TBLSTR* be the character string:

```
UPPER(FK_TABLE_NAME) = UPPER('TBLVAL') AND
```

2) Otherwise:

A) If the value of *NL1* is zero, then let *CATSTR* be a zero-length string; otherwise, let *CATSTR* be the character string:

```
FK_TABLE_CAT = 'CATVAL' AND
```

B) If the value of *NL2* is zero, then let *SCHSTR* be a zero-length string; otherwise, let *SCHSTR* be the character string:

```
FK_TABLE_SCHEM = 'SCHVAL' AND
```

C) If the value of *NL3* is zero, then let *TBLSTR* be a zero-length string; otherwise, let *TBLSTR* be the character string:

FK\_TABLE\_NAME = 'TBLVAL' AND

xx) Let *PRED* be the result of evaluating:

```
CATSTR | | ' ' | | SCHSTR | | ' ' | | TBLSTR | | ' ' | | 1=1
```

xxi) Let *STMT* be the character string:

```
SELECT *
FROM FOREIGN_KEYS_QUERY
WHERE PRED
ORDER BY FK_TABLE_CAT, FK_TABLE_SCHEM, FK_TABLE_NAME, ORDINAL POSITION
```

- xxii) ExecDirect is implicitly invoked with S as the value of StatementHandle, STMT as the value of StatementText, and the length of STMT as the value of TextLength.

  - b) Otherwise:
    - i) Let C be the allocated SQL-connection identified by ConnectionHandle.
    - ii) The diagnostics area associated with C is emptied.
- 2) Let *A* be the value of Attribute.
- 3) If A is not one of the code values in Table 17, "Codes used for connection attributes", then an exception condition is raised: *CLI-specific condition invalid attribute identifier*.
- 4) If A indicates POPULATE IPD, then

#### Case:

- a) If there is no established SQL-connection associated with C, then an exception condition is raised: connection exception connection does not exist.
- b) Otherwise:
  - If POPULATE IPD for C is <u>True</u>, then Value is set to 1 (one).
  - ii) If POPULATE IPD for C is <u>False</u>, then Value is set to 0 (zero).
- 5) If *A* indicates SAVEPOINT NAME, then:
  - a) Let *BL* be the value of BufferLength.
  - b) Let AV be the value of the SAVEPOINT NAME connection attribute.

- The General Rules of Subclause 5.14, "Character string retrieval", are applied with Value, AV, BL, and StringLength as TARGET, VALUE, TARGET OCTET LENGTH, and RETURNED OCTET LENGTH, respectively.
- 6) If A specifies an implementation-defined connection attribute, then

- a) If the data type for the connection attribute is specified in Table 20, "Data types of attributes" as INTEGER, then Value is set to the value of the implementation-defined connection attribute.
- Otherwise:
  - i)
  - ii)
- OCTEL OCTEL OCTEL OF STANDARDS STANDARDS STANDARDS SO. COM. Citck to view the full party of the standard octel oct The General Rules of Subclause 5.14, "Character string retrieval" are applied with Value, AV, iii) BL, and StringLength as TARGET, VALUE, TARGET OCTET LENGTH, and RETURNED

# 6.29 GetCursorName

# **Function**

Get the cursor name property associated with an allocated SQL-statement.

## **Definition**

```
GetCursorName (
StatementHandle IN INTEGER,
CursorName OUT CHARACTER(L),
BufferLength IN SMALLINT,
NameLength OUT SMALLINT)
RETURNS SMALLINT
```

where L has a maximum value equal to the implementation-defined maximum length of a variable-length character string.

- 1) Let S be the allocated SQL-statement identified by StatementHandle.
- 2) Let CN be the cursor name property associated with S.
- 3) Let *BL* be the value of BufferLength.
- 4) The General Rules of Subclause 5.14, "Character string retrieval", are applied with CursorName, *CN*, *BL*, and NameLength as *TARGET*, *VALUE TARGET OCTET LENGTH*, and *RETURNED OCTET LENGTH*, respectively.

# 6.30 GetData

### **Function**

Retrieve a column value.

## **Definition**

GetData (		
StatementHandle	IN	INTEGER,
ColumnNumber	IN	SMALLINT,
TargetType	IN	SMALLINT,
TargetValue	OUT	ANY,
BufferLength	IN	INTEGER,
StrLen_or_Ind	OUT	INTEGER )
THILLIAMS SMAILTAMT		

- 1) Let S be the allocated SQL-statement identified by StatementHandle.
- 2) Case:
  - a) If there is no fetched rowset associated with sthen an exception condition is raised: *CLI-specific condition* function sequence error.
  - b) If the fetched rowset associated with Sis empty, then a completion condition is raised: *no data*, TargetValue and StrLen\_or\_Ind are set to implementation-dependent values, and no further rules of this Subclause are applied.
  - c) Otherwise, let R be the fetched rowset associated with S.
- 3) Let *ARD* be the current application row descriptor for *S* and let *N* be the value of the TOP\_LEVEL\_COUNT field of *ARD*.
- 4) Let *AS* be the value of the ARRAY\_SIZE field in the header of *ARD*. Let *P* be the value of the attribute CURRENT OF POSITION of *S*.
- 5) Let CR be the CLI cursor associated with S.
- 6) If *P* is greater than *AS*, the *P*-th row in *R* has not been fetched, or the operational scrollability property of *CR* is NO SCROLL and *AS* is greater than 1 (one), then an exception condition is raised: *CLI-specific condition invalid cursor position*.
- 7) Let FR be the P-th row of R.
- 8) Let D be the degree of the table defined by the select source associated with S.
- 9) If *N* is less than zero, then an exception condition is raised: *dynamic SQL error*—invalid descriptor count.
- 10) Let *CN* be the value of ColumnNumber.

# ISO/IEC 9075-3:2016(E) 6.30 GetData

- 11) If CN is less than 1 (one) or greater than D, then an exception condition is raised: dynamic SQL error—invalid descriptor index.
- 12) If DATA\_POINTER is non-zero for at least one of the first *N* item descriptor areas of *ARD* for which LEVEL is 0 (zero) and the value of TYPE is neither ROW, ARRAY, nor MULTISET, then let *BCN* be the column number associated with such an item descriptor area and let *HBCN* be the value of MAX(*BCN*). Otherwise, let *HBCN* be zero.
- 13) Let *IDA* be the item descriptor area of *ARD* specified by *CN*. If the value of TYPE in *IDA* is either ROW, ARRAY, or MULTISET, or if the LEVEL of *IDA* is greater than 0 (zero), then an exception condition is raised: *dynamic SQL error invalid descriptor index*.

NOTE 34 — GetData cannot be called to retrieve the data corresponding to a subordinate descriptor cord such as, for example, from an individual field of a ROW type.

14) If CN is not greater than HBCN, then

#### Case:

- a) If the DATA\_POINTER field of *IDA* is not zero, then an exception condition is raised: *dynamic SQL error invalid descriptor index*.
- b) If the DATA\_POINTER field of *IDA* is zero, then it is implementation-defined whether an exception condition is raised: *dynamic SQL error invalid descriptor index*.

NOTE 35 — This implementation-defined feature determines whether columns before the highest bound column can be accessed by GetData.

15) If there is a fetched column number associated with FR, then let FCN be that column number; otherwise, let FCN be zero.

NOTE 36 — "fetched column number" is the Column Number value used with the previous invocation (if any) of the GetData routine with FR. See the General Rules later in this Subclause where this value is set.

- 16) Case:
  - a) If *FCN* is greater than zero and *CN* is not greater than *FCN*, then it is implementation-defined whether an exception condition is raised: *dynamic SQL error invalid descriptor index*.

NOTE 37 — This implementation-defined feature determines whether GetData can only access columns in ascending column number order.

- b) If FCN is less than zero, then:
  - i) Let AFCN be the absolute value of FCN.
  - ii) Case:
    - 1) If CN is less than AFCN, then it is implementation-defined whether an exception condition is raised: dynamic SQL error invalid descriptor index.

NOTE 38 — This implementation-defined feature determines whether GetData can only access columns in ascending column number order.

- 2) If CN is greater than AFCN, then let FCN be AFCN.
- 17) Let *T* be the value of TargetType.
- 18) Let *HL* be the programming language of the invoking host program. Let *operative data type correspondence table* be the data type correspondence table for *HL* as specified in Subclause 5.20, "SQL/CLI data type

- correspondences". Refer to the two columns of the operative data type correspondence table as the *SQL* data type column and the host data type column.
- 19) If either of the following is true, then an exception condition is raised: *CLI-specific condition invalid data type in application descriptor*.
  - a) *T* indicates neither DEFAULT nor ARD TYPE and is not one of the code values in Table 8, "Codes used for application data types in SQL/CLI".
  - b) *T* is one of the code values in Table 8, "Codes used for application data types in SQL/CLL" but the row that contains the corresponding SQL data type in the SQL data type column of the operative data type correspondence table contains 'None' in the host data type column.
- 20) If *T* does not indicate ARD TYPE, then the data type of the <target specification> described by *IDA* is set to *T*.
- 21) Let *IRD* be the implementation row descriptor associated with *S*.
- 22) If the value of the TYPE field of *IDA* indicates DEFAULT, then:
  - a) Let CT, P, and SC be the values of the TYPE, PRECISION, and SCALE fields, respectively, for the CN-th item descriptor area of IRD for which LEVEL is 0 (zero).
  - b) The data type, precision, and scale of the <target specification> described by *IDA* are set to *CT*, *P*, and *SC*, respectively, for the purposes of this GetData invocation only.
- 23) If *IDA* is not valid as specified in Subclause 5.18, "Description of CLI item descriptor areas", then an exception condition is raised: *dynamic SQL error*—using clause does not match target specifications.
- 24) Let TT be the value of the TYPE field of IDA.
- 25) Case:
  - a) If TT indicates CHARACTER, then:
    - i) Let *UT* be the code value corresponding to CHARACTER VARYING as specified in Table 7, "Codes used for implementation data types in SQL/CLI".
    - ii) Let *CL* be the implementation-defined maximum length for a CHARACTER VARYING data type.
  - b) Otherwise, let *VT* be *TT* and let *CL* be zero.
- 26) Case:
  - a) If FCV is less than zero, then

Case:

- i) If TT does not indicate CHARACTER, CHARACTER LARGE OBJECT, BINARY, BINARY VARYING, or BINARY LARGE OBJECT, then AFCN becomes the fetched column number associated with the fetched row associated with S and an exception condition is raised: dynamic SQL error invalid descriptor index.
- ii) Otherwise, let *FL*, *DV*, and *DL* be the fetched length, data value and data length, respectively, associated with *FCN* and let *TV* be the result of the <string value function>:

```
SUBSTRING ( DV FROM (FL+1) )
```

#### ISO/IEC 9075-3:2016(E) 6.30 GetData

- b) Otherwise:
  - i) Let *FL* be zero.
  - ii) Let SDT be the effective data type of the CN-th < select list> column as represented by the values of the TYPE, LENGTH, PRECISION, SCALE, DATETIME\_INTERVAL\_CODE, DATE-TIME INTERVAL PRECISION, CHARACTER SET CATALOG, CHARAC-TER\_SET\_SCHEMA, CHARACTER\_SET\_NAME, USER\_DEFINED\_TYPE\_CATALOG, USER\_DEFINED\_TYPE\_SCHEMA, USER\_DEFINED\_TYPE\_NAME, SCOPE\_CANALOG, SCOPE\_SCHEMA, and SCOPE\_NAME fields in the CN-th item descriptor area of IRD. Let SV be the value of the <select list> column, with data type SDT.
  - If TYPE indicates USER-DEFINED TYPE, then let the most specific type of the CN-th < select iii) list> column whose value is SV be represented by the values of the SPECIFIC\_TYPE\_CATA-LOG, SPECIFIC\_TYPE\_SCHEMA, and SPECIFIC\_TYPE\_NAME fields in the corresponding item descriptor area of IRD.
  - Let TDT be the effective data type of the CN-th <target specification> as represented by the iv) type UT, the length value CL, and the values of the PRECISION, SCALE, CHARAC-TER SET CATALOG, CHARACTER SET SCHEMA, CHARACTER SET NAME, USER DEFINED TYPE CATALOG, USER DEFINED TYPE SCHEMA, USER\_DEFINED\_TYPE\_NAME, SCOPE\_CATALOG, SCOPE\_SCHEMA, and SCOPE\_NAME fields of *IDA*.
  - Let LTDT be the data type on the last retrieval of the CN-th <target specification>, if any. If v) any of the following is true, then it is implementation-defined whether or not exception condition is raised: dynamic SQL error — restricted data type attribute violation.
    - 1) If LTDT and TDT both identify a binary large object type and only one of LTDT and TDT is a binary large object locator.
    - 2) If LTDT and TDT both identify a character large object type and only one of LTDT and TDT is a character large object locator.
    - 3) If LTDT and TDT both identify an array type and only one of LTDT and TDT is an array locator.
    - If LTDT and TDT both identify a multiset type and only one of LTDT and TDT is a multiset locator
    - 5) If LTDT and TDT both identify a user-defined type and only one of LTDT and TDT is a user-defined type locator.
  - Case:
    - 1) If TDT is a locator type, then

Case:

- A) If SV is not the null value, then a locator L that uniquely identifies SV is generated and the value TV of the CN-th <target specification> is set to an implementation-dependent four-octet value that represents L.
- B) Otherwise, the value TV of the CN-th <target specification> is the null value.
- 2) If SDT and TDT are predefined data types, then

#### Case:

A) If the <cast specification>

```
CAST ( SV AS TDT )
```

does not conform to the Syntax Rules of Subclause 6.13, "<cast specification>", in [ISO9075-2], and there is an implementation-defined conversion from type *SDT* to type *TDT*, then that implementation-defined conversion is effectively performed, converting *SV* to type *TDT*, and the result is the value *TV* of the *CN*-th <target specification>.

- B) Otherwise:
  - I) If the <cast specification>

```
CAST ( SV AS TDT )
```

does not conform to the Syntax Rules of Subclause 6.13, "<cast specification>", in [ISO9075-2], then an exception condition is raised: *dynamic SQL error*—restricted data type attribute violation.

II) The <cast specification>

```
CAST ( SV AS TDT )
```

is effectively performed, and the result is the value TV of the CN-th <target specification>.

- 3) If *SDT* is a user-defined type and *TDT* is a predefined data type, then:
  - A) Let DT be the data type identified by SDT.
  - B) If the current SQL session has a group name corresponding to the user-defined name of *DT*, then let *GN* be that group name; otherwise, let *GN* be the default transform group name associated with the current SQL-session.
  - C) The Syntax Rules of Subclause 9.25, "Determination of a from-sql function", in [ISO9075-2], are applied with *DT* and *GN* as *TYPE* and *GROUP*, respectively.

Case:

I) If there is an applicable from-sql function, then let *FSF* be that from-sql function and let *FSFRT* be the <returns data type> of *FSF*.

- 1) If *FSFRT* is compatible with *TD*T, then the from-sql function *TSF* is effectively invoked with *SV* as its input parameter and the <return value> is the value *TV* of the *CN*-th <target specification>.
- 2) Otherwise, an exception condition is raised: *dynamic SQL error restricted data type attribute violation*.
- II) Otherwise, an exception condition is raised: *dynamic SQL error data type transform function violation*.
- 27) CN becomes the fetched column number associated with the fetched row associated with S.

### ISO/IEC 9075-3:2016(E) 6.30 GetData

28) If TV is the null value, then

- a) If StrLen or Ind is a null pointer, then an exception condition is raised: data exception null value, no indicator parameter.
- b) Otherwise, StrLen or Ind is set to the appropriate 'Code' for SQL NULL DATA in Table 27, "Miscellaneous codes used in CLI", and the value of TargetValue is implementation-dependent.
- 29) Let *OL* be the value of BufferLength.
- 30) If null termination is *True* for the current SQL-environment, then let NB be the length in octets of a null terminator in the character set of the *i*-th bound target; otherwise let NB be 0 (zero).
- 31) If TV is not the null value, then:
  - a) StrLen\_or\_Ind is set to 0 (zero).
  - b) Case:
    - If TT does not indicate CHARACTER, CHARACTER LARGE OBJECT, BINARY, BINARY i) VARYING, or BINARY LARGE OBJECT, then Target Value is set to TV.
    - ii) Otherwise:
      - 1) If TT is CHARACTER or CHARACTER LARGE OBJECT, then:
        - A) If TV is a zero-length character string, then it is implementation-defined whether or not an exception condition is taised: data exception — zero-length character string.
        - B) The General Rules of Subclause 5.14, "Character string retrieval", are applied with Target Value, TV, OL, and StrLen or Ind as TARGET, VALUE, OCTET LENGTH, and RETURNED OCTET LENGTH, respectively.
      - 2) If TT is BINARY, BINARY VARYING, or BINARY LARGE OBJECT, then the General Rules of Subclause 5.15, "Binary string retrieval", are applied with TargetValue, TV, OL, and StrLen of Ind as TARGET, VALUE, OCTET LENGTH, and RETURNED OCTET *LENGTH*, respectively.
      - If FCN is not less than zero, then let DV be TV and let DL be the length of TV in octets.
      - Let FL be (FL+OL-NB).
        - If FL is less than DL, then -CN becomes the fetched column number associated with the fetched row associated with S and FL, DV and DL become the fetched length, data value, and data length, respectively, associated with the fetched column number.

### 6.31 GetDescField

### **Function**

Get a field from a CLI descriptor area.

### **Definition**

```
GetDescField (
   DescriptorHandle
                          ΤN
                                    INTEGER,
    RecordNumber
                          IN
                                    SMALLINT,
    FieldIdentifier
                         IN
                                    SMALLINT,
    Value
                         OUT
                                    ANY.
    BufferLength
                          IN
                                    INTEGER.
                                    INTEGER )
    StringLength
                          OUT
    RETURNS SMALLINT
```

### **General Rules**

- 1) Let *D* be the allocated CLI descriptor area identified by DescriptorHandle and let *N* be the value of the COUNT field of *D*.
- 2) Let FI be the value of FieldIdentifier.
- 3) If FI is not one of the code values in Table 21, Codes used for SQL/CLI descriptor fields", then an exception condition is raised: CLI-specific condition invalid descriptor field identifier.
- 4) Let RN be the value of RecordNumber
- 5) Let *TYPE* be the value of the Type column in the row of Table 21, "Codes used for SQL/CLI descriptor fields", that contains *FI*.
- 6) The General Rules of Subctause 5.16, "Deferred parameter check", are applied to *D* as the DESCRIPTOR AREA.
- 7) If TYPE is 'ITEM', then:
  - a) If RN is less than 1 (one), then an exception condition is raised: dynamic SQL error invalid descriptor index.
  - b) If RN is greater than N, then a completion condition is raised: no data.
- 8) If D is an implementation row descriptor, then let S be the allocated SQL-statement associated with D.
- 9) Let *MBR* be the value of the May Be Retrieved column in the row of Table 23, "Ability to retrieve SQL/CLI descriptor fields", that contains *FI* and the column that contains the descriptor type *D*.
- 10) If *MBR* is 'PS' and there is no prepared or executed statement associated with *S*, then an exception condition is raised: *CLI-specific condition associated statement is not prepared*.
- 11) If *MBR* is 'No', then an exception condition is raised: *CLI-specific condition invalid descriptor field identifier*.

### ISO/IEC 9075-3:2016(E) 6.31 GetDescField

- 12) If FI indicates a descriptor field whose value is the initially undefined value created when the descriptor was created, then an exception condition is raised: CLI-specific condition — invalid descriptor field identifier.
- 13) Let *IDA* be the item descriptor area of *D* specified by *RN*.
- 14) If TYPE is 'HEADER', then header information from the descriptor area D is retrieved as follows.

#### Case:

- a) If FI indicates COUNT, then the value retrieved is N.
- If FI indicates ALLOC\_TYPE, then the value retrieved is the allocation type for D<sub>e</sub>
- If FI indicates an implementation-defined descriptor header field, then the value retrieved is the value of the implementation-defined descriptor header field identified by FI.
- d) Otherwise, if FI indicates a descriptor header field defined in Table 21, \*\*Odes used for SQL/CLI descriptor fields", then the value retrieved is the value of the descriptor header field identified by FI.
- 15) If TYPE is 'ITEM', then item information from the descriptor area D is retrieved as follows:

- If FI indicates an implementation-defined descriptor item field, then the value retrieved is the value of the implementation-defined descriptor item field of  $\overline{D}A$  identified by FI.
- b) Otherwise, if FI indicates a descriptor item field defined in Table 21, "Codes used for SQL/CLI descriptor fields", then the value retrieved is the value of the descriptor item field of IDA identified by FI.
- 16) Let V be the value retrieved.
- 17) If FI indicates a descriptor field whose row in Table 6, "Fields in SQL/CLI row and parameter descriptor areas", contains a Data Type that is not CHARACTER VARYING, then Value is set to V and no further rules of this Subclause are applied.
- 18) Let *BL* be the value of BufferLength.
- 19) If FI indicates a descriptor field whose row in Table 6, "Fields in SQL/CLI row and parameter descriptor areas", contains a Data Type that is CHARACTER VARYING, then the General Rules of Subclause 5.14, "Character string retrieval", are applied with Value, V, BL, and StringLength as TARGET, VALUE, TARGET OCTET LENGTH, and RETURNED OCTET LENGTH, respectively.

### 6.32 GetDescRec

### **Function**

Get commonly-used fields from a CLI descriptor area.

### **Definition**

```
III. P.D.F. of ISOII.E.C. oo 15.3:2016
GetDescRec (
    DescriptorHandle
                          ΤN
                                     INTEGER,
    RecordNumber
                          IN
                                     SMALLINT,
    Name
                          OUT
                                     CHARACTER(L),
    BufferLength
                          IN
                                     SMALILINT.
   NameLength
                          OUT
                                     SMALLINT,
    Type
                          OUT
                                     SMALLINT,
    SubType
                          OUT
                                     SMALLINT,
    Length
                          OUT
                                     INTEGER,
    Precision
                          OUT
                                     SMALLINT,
    Scale
                          OUT
                                     SMALLINT,
    Nullable
                          OUT
                                     SMALLINT )
    RETURNS SMALLINT
```

where L has a maximum value equal to the implementation defined maximum length of a variable-length character string.

### **General Rules**

- 1) Let D be the allocated CLI descriptor area identified by Descriptor Handle and let N be the value of the COUNT field of D.
- 2) The General Rules of Subclause 5.16, "Deferred parameter check", are applied to D as the DESCRIPTOR AREA.
- 3) Let RN be the value of RecordNumber.
- 4) Case:
  - a) If RN is less than 1 (one), then an exception condition is raised: dynamic SQL error invalid descriptor index.
  - Otherwise, if RN is greater than N, then a completion condition is raised: no data.
- 5) If D is an implementation row descriptor associated with an allocated SQL-statement S and there is no prepared or executed statement associated with S, then an exception condition is raised: CLI-specific condition — associated statement is not prepared.
- 6) Let ITEM be the <dynamic parameter specification> or <select list> column (or part thereof, if the item descriptor area of D is a subordinate descriptor) described by the item descriptor area of D specified by RN.
- 7) Let *BL* be the value of BufferLength.
- Information is retrieved from *D*:

### ISO/IEC 9075-3:2016(E) 6.32 GetDescRec

- If Type is not a null pointer, then Type is set to the value of the TYPE field of *ITEM*.
- b) If SubType is not a null pointer, then SubType is set to the value of the DATETIME INTER-VAL CODE field of ITEM.
- If Length is not a null pointer, then Length is set to value of the OCTET\_LENGTH field of *ITEM*.
- If Precision is not a null pointer, then Precision is set to the value of the PRECISION field of *ITEM*.
- If Scale is not a null pointer, then Scale is set to the value of the SCALE field of ITEM.
- If Nullable is not a null pointer, then Nullable is set to the value of the NULLABLE field of ITEM.
- g) If Name is not a null pointer, then

- If null termination is *False* for the current SQL-environment and *BL* is zero, then no further i) rules of this Subclause are applied.
- ii) Otherwise:
  - 1) The value retrieved is the value of the NAME field of *ITEM*.
  - 2) Let *V* be the value retrieved.
  - The General Rules of Subclause 5.14, "Character string retrieval", are applied with Name, V, BL, and NameLength as TARGET, VALUE, TARGET OCTET LENGTH, and RETURNED

### 6.33 GetDiagField

### **Function**

Get information from a CLI diagnostics area.

### **Definition**

GetDiagField (		
HandleType	IN	SMALLINT,
Handle	IN	INTEGER,
RecordNumber	IN	SMALLINT,
DiagIdentifier	IN	SMALLINT,
DiagInfo	OUT	ANY,
BufferLength	IN	SMALLINT,
StringLength	OUT	SMALLINT )
RETURNS SMALLINT		

### **General Rules**

- 1) Let *HT* be the value of HandleType.
- A SUITE OF ISOINE COOTS AND TO SERVICE OF ISOINE COOTS AND TO 2) If HT is not one of the code values in Table 14, "Codes used for SQL/CLI handle types", then an exception condition is raised: *CLI-specific condition* — *invalid handle*.
- 3) Case:
  - a) If HT indicates ENVIRONMENT HANDLE and Handle does not identify an allocated SQL-environment, then an exception condition is raised: CLI-specific condition — invalid handle.
  - b) If HT indicates CONNECTION HANDLE and Handle does not identify an allocated SQL-connection, then an exception condition is raised: *CLI-specific condition* — *invalid handle*.
  - If HT indicates STATEMENT HANDLE and Handle does not identify an allocated SQL-statement, then an exception condition is raised: *CLI-specific condition* — invalid handle.
  - d) If HT indicates DESCRIPTOR HANDLE and Handle does not identify an allocated CLI descriptor area, then an exception condition is raised: *CLI-specific condition* — invalid handle.
- 4) Let *DI* be the value of DiagIdentifier.
- 5) If DL is not one of the code values in Table 13, "Codes used for SQL/CLI diagnostic fields", then an exception condition is raised: *CLI-specific condition* — *invalid attribute value*.
- 6) Let TYPE be the value of the Type column in the row that contains DI in Table 13, "Codes used for SQL/CLI diagnostic fields".
- 7) Let RN be the value of RecordNumber.
- 8) Let R be the most recently executed CLI routine, other than GetDiagRec, GetDiagField, or Error, for which Handle was passed as the value of an input handle and let N be the number of status records generated by the execution of R.

### ISO/IEC 9075-3:2016(E) 6.33 GetDiagField

NOTE 39 — The GetDiagRec, GetDiagField, and Error routines may cause exception or completion conditions to be raised, but they do not cause diagnostic information to be generated.

- 9) If *TYPE* is 'STATUS', then:
  - a) If RN is less than 1 (one), then an exception condition is raised: invalid condition number.
  - b) If RN is greater than N, then a completion condition is raised: no data, and no further rules of this Subclause are applied.
- 10) If DI indicates ROW COUNT and R is neither Execute nor ExecDirect, then an exception condition is raised: *CLI-specific condition* — *invalid attribute identifier*.
- 11) If TYPE is 'HEADER', then header information from the diagnostics area associated with the resource identified by Handle is retrieved.
  - a) If DI indicates NUMBER, then the value retrieved is N.
  - b) If DI indicates DYNAMIC\_FUNCTION, then

Case:

- If no SOL-statement was being prepared or executed by R, then the value retrieved is a zeroi) length string.
- Otherwise, the value retrieved is the character identifier of the SQL-statement being prepared ii) or executed by R. The value DYNAMIC\_FUNCTION values are specified in Table 37, "SQLstatement codes", in [ISO9075-2].

NOTE 40 — Additional valid DYNAMIC PUNCTION values may be defined in other parts of ISO/IEC 9075.

c) If *DI* indicates DYNAMIC FUNCTION CODE, then

Case:

- If no SQL-statement was being prepared or executed by R, then the value retrieved is 0 (zero). i)
- Otherwise, the value retrieved is the integer identifier of the SQL-statement being prepared or ii) executed by R. The value DYNAMIC\_FUNCTION\_CODE values are specified in Table 37, "SQL-statement codes", in [ISO9075-2].

NOTE 4. Additional valid DYNAMIC\_FUNCTION\_CODE values may be defined in other parts of ISO/IEC 9075.

d) If DI indicates RETURNCODE, then the value retrieved is the code indicating the basic result of the execution of R. Subclause 4.2, "Return codes", specifies the code values and their meanings.

NOTE 42 — The value retrieved will never indicate **Invalid handle** or **Data needed**, since no diagnostic information is generated if this is the basic result of the execution of R.

e) If DI indicates ROW COUNT, the value retrieved is the number of rows affected as the result of executing a <delete statement: searched>, <insert statement>, <merge statement>, or <update statement: searched> as a direct result of the execution of the SQL-statement executed by R. Let S be the <delete statement: searched>, <insert statement>, <merge statement>, or <update statement: searched>. Let T be the table identified by the directly contained in S.

Case:

i) If S is an <insert statement>, then the value retrieved is the number of rows inserted into T. ii) If *S* is a <merge statement>, then let *TR1* be the <target table> immediately contained in *S*, let *TR2* be the immediately contained in *S*, and let *SC* be the <search condition> immediately contained in *S*. If <merge correlation name> is specified, let *MCN* be "AS <merge correlation name>"; otherwise, let *MCN* be a zero-length string.

#### Case:

1) If S contains a <merge when matched clause> and does not contain a <merge when not matched clause>, then the value retrieved is effectively derived by executing the statement:

```
SELECT COUNT (*)
FROM TR1 MCN, TR2
WHERE SC
```

before the execution of *S*.

2) If S contains a <merge when not matched clause> and does not contain a <merge when matched clause>, then the value retrieved is effectively derived by executing the statement:

```
( SELECT COUNT(*)
FROM TR1 MCN
RIGHT OUTER JOIN
TR2
ON SC )

( SELECT COUNT (*)
FROM TR1 MCN, TR2
WHERE SC )
```

before the execution of S.

3) If S contains both a <merge when matched clause> and a <merge when not matched clause>, then the value retrieved is effectively derived by executing the statement:

```
SELECT COUNT(*).
FROM TR1 MCN
RIGHT OUTER JOIN
TR2
ON SC
```

before the execution of *S*.

iii) If Sis a <delete statement: searched> or an <update statement: searched>, then

Case:

- 1) If S does not contain a <search condition>, then the value retrieved is the cardinality of T before the execution of S.
- 2) Otherwise, let *SC* be the <search condition> directly contained in *S*. The value retrieved is effectively derived by executing the statement:

```
SELECT COUNT(*) FROM T WHERE SC
```

before the execution of S.

# ISO/IEC 9075-3:2016(E) 6.33 GetDiagField

The value retrieved following the execution by *R* of an SQL-statement that does not directly result in the execution of a <delete statement: searched>, <insert statement>, <merge statement>, or <update statement: searched> is implementation-dependent.

f) If DI indicates MORE, then the value retrieved is

#### Case:

- i) If more conditions were raised during execution of *R* than have been stored in the diagnostics area, then 1 (one).
- ii) If all the conditions that were raised during execution of R have been stored in the diagnostics area, then 0 (zero).
- g) If *DI* indicates TRANSACTIONS\_COMMITTED, then the value retrieved is the number of SQL-transactions that have been committed since the most recent time at which the diagnostics area for *HT* was emptied.

NOTE 43 — See the General Rules of Subclause 13.3, "<externally-invoked procedure>", in [ISO9075-2]. TRANSAC-TIONS\_COMMITTED indicates the number of SQL-transactions that were committed during the invocation of an external routine.

h) If *DI* indicates TRANSACTIONS\_ROLLED\_BACK, then the value retrieved is the number of SQL-transactions that have been rolled back since the most recent time at which the diagnostics area for *HT* was emptied.

NOTE 44 — See the General Rules of Subclause 13.3, "<externally-invoked procedure>", in [ISO9075-2]. TRANSAC-TIONS\_ROLLED\_BACK indicates the number of SQL-transactions that were rolled back during the invocation of an external routine

i) If *DI* indicates TRANSACTION\_ACTIVE then the value retrieved is 1 (one) if an SQL-transaction is currently active and is 0 (zero) if an SQL-transaction is not currently active.

NOTE 45 — TRANSACTION\_ACTIVE indicates whether an SQL-transaction is active upon return from an external routine.

- j) If *DI* indicates an implementation-defined diagnostics header field, then the value retrieved is the value of the implementation-defined diagnostics header field.
- 12) If *TYPE* is 'STATUS', then information from the *RN*-th status record in the diagnostics area associated with the resource identified by Handle is retrieved.
  - a) If *DI* indicates CONDITION\_NUMBER, then the value retrieved is *RN*.
  - b) If *DI* indicates SQLSTATE, then the value retrieved is the SQLSTATE value corresponding to the status condition.
  - c) If D indicates NATIVE\_CODE, then the value retrieved is the implementation-defined native error code corresponding to the status condition.
  - d) If DI indicates MESSAGE\_TEXT, then the value retrieved is

- i) If the value of SQLSTATE corresponds to *external routine invocation exception*, *external routine exception*, or *warning*, then the message text item of the SQL-invoked routine that raised the exception condition.
- ii) Otherwise, an implementation-defined character string.

NOTE 46 — An implementation may provide <space>s or a zero-length string or a character string that describes the status condition.

- e) If *DI* indicates MESSAGE\_LENGTH, then the value retrieved is the length in characters of the character string value of MESSAGE\_TEXT corresponding to the status condition.
- f) If *DI* indicates MESSAGE\_OCTET\_LENGTH, then the value retrieved is the length in octets of the character string value of MESSAGE\_TEXT corresponding to the status condition.
- g) If *DI* indicates CLASS\_ORIGIN, then the value retrieved is the identification of the naming authority that defined the class code of the SQLSTATE value corresponding to the status condition. That value shall be 'ISO 9075' if the class code is fully defined in Subclause 24.1, "SQLSTATE" in [ISO 9075-2] or Subclause 5.17, "CLI-specific status codes", and shall be an implementation-defined character string other than 'ISO 9075' for any implementation-defined class code.
- h) If *DI* indicates SUBCLASS\_ORIGIN, then the value retrieved is the identification of the naming authority that defined the subclass code of the SQLSTATE value corresponding to the status condition. That value shall be 'ISO 9075' if the subclass code is fully defined in Subclause 24.1, "SQLSTATE", in [ISO9075-2], or Subclause 5.17, "CLI-specific status codes", and shall be an implementation-defined character string other than 'ISO 9075' for any implementation-defined subclass code.
- i) If *DI* indicates CURSOR\_NAME, CONSTRAINT\_CATALOG, CONSTRAINT\_SCHEMA, CONSTRAINT\_NAME, CATALOG\_NAME, SCHEMA\_NAME, TABLE\_NAME, COLUMN\_NAME, PARAMETER\_MODE, PARAMETER\_NAME, PARAMETER\_ORDINAL\_POSITION, ROUTINE\_CATALOG, ROUTINE\_SCHEMA, ROUTINE\_NAME, SPECIFIC\_NAME, TRIGGER\_CATALOG, TRIGGER\_SCHEMA, or TRIGGER\_NAME, then the values retrieved are

#### Case:

- i) If the value of SQLSTATE corresponds to *warning cursor operation conflict*, then the value of CURSOR\_NAME is the name of the cursor that caused the completion condition to be raised.
- ii) If the value of SQLSTATE corresponds to integrity constraint violation, transaction rollback integrity constraint violation, or triggered data change violation, then:
  - 1) The values of CONSTRAINT\_CATALOG and CONSTRAINT\_SCHEMA are the <catalog name> and the <unqualified schema name> of the <schema name> of the schema containing the constraint or assertion. The value of CONSTRAINT\_NAME is the <qualified identifier> of the constraint or assertion.
  - 2) Case:

If the violated integrity constraint is a table constraint, then the value of TABLE\_NAME is the <qualified identifier> of the table *TBL* in which the table constraint is contained.

- I) If *TBL* is a declared local temporary table, then the values of CATA-LOG\_NAME and SCHEMA\_NAME are spaces and 'MODULE', respectively.
- II) Otherwise, the values of CATALOG\_NAME and SCHEMA\_NAME are the <catalog name> and the <unqualified schema name> of the <schema name> of *TBL*, respectively.
- B) If the violated integrity constraint is an assertion and if only one table referenced by the assertion has been modified as a result of executing the SQL-statement, then the

- values of CATALOG\_NAME, SCHEMA\_NAME, and TABLE\_NAME are the <catalog name>, the <unqualified schema name> of the <schema name>, and the <qualified identifier>, respectively, of the modified table.
- C) Otherwise, the values of CATALOG\_NAME, SCHEMA\_NAME, and TABLE\_NAME are <space>s.
- iii) If the value of SQLSTATE corresponds to syntax error or access rule violation, then:
  - 1) The values of CATALOG\_NAME, SCHEMA\_NAME, and TABLE\_NAME are the <catalog name>, the <unqualified schema name> of the <schema name> of the schema that contains the table that caused the syntax error or the access rule violation and the <qualified identifier>, respectively. If TABLE\_NAME refers to a declared local temporary table, then CATALOG\_NAME is <space>s and SCHEMA\_NAME contains 'MODULE'.
  - 2) If the syntax error or the access rule violation was for an inaccessible column, then the value of COLUMN\_NAME is the <column name> of that column. Otherwise, the value of COLUMN\_NAME is <space>s.
- iv) If the value of SQLSTATE corresponds to *invalid cursor state*, then the value of CURSOR\_NAME is the name of the CLI cursor that is in the invalid state.
- v) If the value of SQLSTATE corresponds to *with check option violation*, then the values of CATALOG\_NAME, SCHEMA\_NAME, and TABLE\_NAME are the <catalog name> and the <unqualified schema name> of the <schema name> of the schema that contains the view that caused the violation of the WITH CHECK OPTION, and the <qualified identifier> of that view, respectively.
- vi) If the value of SQLSTATE does not correspond to syntax error or access rule violation, then:
  - 1) If the values of CATALOG NAME, SCHEMA\_NAME, TABLE\_NAME, and COL-UMN\_NAME identify a column for which no privileges are granted to the enabled authorization identifiers, then the value of COLUMN\_NAME is replaced by a zero-length string.
  - 2) If the values of CATALOG\_NAME, SCHEMA\_NAME, and TABLE\_NAME identify a table for which no privileges are granted to the enabled authorization identifiers, then the values of CATALOG\_NAME, SCHEMA\_NAME, and TABLE\_NAME are replaced by a zero-length string.
  - 3) If the values of CONSTRAINT\_CATALOG, CONSTRAINT\_SCHEMA, and CONSTRAINT\_NAME identify a for some table *T* and if no privileges for *T* are granted to the enabled authorization identifiers, then the values of CONSTRAINT\_CATALOG, CONSTRAINT\_SCHEMA, and CONSTRAINT\_NAME are replaced by a zero-length string.
  - 4) If the values of CONSTRAINT\_CATALOG, CONSTRAINT\_SCHEMA, and CONSTRAINT\_NAME identify an assertion contained in some schema *S* and if the owner of *S* is not included in the set of enabled authorization identifiers, then the values of CONSTRAINT\_CATALOG, CONSTRAINT\_SCHEMA, and CONSTRAINT\_NAME are replaced by a zero-length string.
- vii) If the value of SQLSTATE corresponds to *triggered action exception*, to *transaction rollback triggered action exception*, or to *triggered data change violation* that was caused by a trigger, then:

- 1) The values of TRIGGER\_CATALOG and TRIGGER\_SCHEMA are the <catalog name> and the <unqualified schema name>, respectively, of the <schema name> of the schema containing the trigger. The value of TRIGGER\_NAME is the <qualified identifier> of the <trigger name> of the trigger.
- 2) The values of CATALOG\_NAME, SCHEMA\_NAME, and TABLE\_NAME are the <a href="catalog name"><a href="catalog name"><
- viii) If the value of SQLSTATE corresponds to external routine invocation exception, or to external routine exception, then:
  - 1) The values of ROUTINE\_CATALOG and ROUTINE\_SCHEMA are the catalog name and the <unqualified schema name >, respectively, of the <schema name > of the schema containing the SQL-invoked routine.
  - 2) The values of ROUTINE\_NAME and SPECIFIC\_NAME are the <identifier> of the <routine name> and the <identifier> of the <specific name> of the SQL-invoked routine, respectively.
  - 3) Case:
    - A) If the condition is related to some parameter  $P_i$  of the SQL-invoked routine, then:
      - I) The value of PARAMETER\_MODE is the  $\langle$ parameter mode $\rangle$  of  $P_i$ .
      - II) The value of PARAMETER\_ORDINAL\_POSITION is the value of *i*.
      - III) The value of PARAMETER\_NAME is a zero-length string.
    - B) Otherwise:
      - I) The value of PARAMETER\_MODE is a zero-length string.
      - II) The value of PARAMETER ORDINAL POSITION is 0 (zero).
      - III) The value of PARAMETER\_NAME is a zero-length string.
- ix) If the value of SQLSTATE corresponds to data exception numeric value out of range, data exception—invalid character value for cast, data exception—string data, right truncation, data exception—interval field overflow, integrity constraint violation, or warning—string data, right truncation, and the condition was raised as the result of an assignment to an SQL parameter during an SQL-invoked routine invocation, then:
  - The values of ROUTINE\_CATALOG and ROUTINE\_SCHEMA are the <catalog name> and <unqualified schema name>, respectively, of the <schema name> of the schema containing the SQL-invoked routine.
  - 2) The values of ROUTINE\_NAME and SPECIFIC\_NAME are the <identifier> of the <routine name> and the <identifier> of the <specific name>, respectively, of the SQL-invoked routine.
  - 3) If the condition is related to some parameter  $P_i$  of the SQL-invoked routine, then:
    - A) The value of PARAMETER\_MODE is the <parameter mode> of  $P_i$ .
    - B) The value of PARAMETER ORDINAL POSITION is the value of i.

# ISO/IEC 9075-3:2016(E) 6.33 GetDiagField

- C) If an <SQL parameter name> was specified for the SQL parameter when the SQL-invoked routine was created, then the value of PARAMETER\_NAME is the <SQL parameter name> of that SQL parameter, P<sub>i</sub>; otherwise, the value of PARAME-TER\_NAME is a zero-length string.
- j) If DI indicates SERVER\_NAME or CONNECTION\_NAME, then the values retrieved are

#### Case:

- i) If *R* is Connect, then the name of the SQL-server explicitly or implicitly referenced by *R* and the implementation-defined connection name associated with that SQL-server reference, respectively.
- ii) If *R* is Disconnect, then the name of the SQL-server and the associated implementation-defined connection name, respectively, associated with the allocated SQL-connection referenced by *R*.
- iii) If the status condition was caused by the application of the General Rules of Subclause 5.3, "Implicit set connection", then the name of the SQL-server and the implementation-defined connection name, respectively, associated with the dormant SQL-connection specified in the application of that Subclause.
- iv) If the status condition was raised in an SQL-session, then the name of the SQL-server and the implementation-defined connection name, respectively, associated with the SQL-session in which the status condition was raised.
- v) Otherwise, zero-length strings.
- k) If DI indicates CONDITION IDENTIFIER, then the value retrieved is

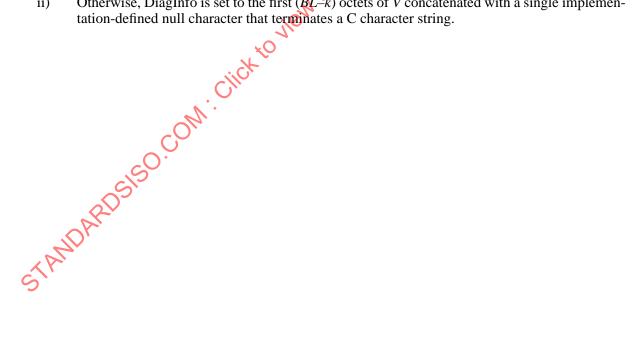

- i) If the value of SQLSTATE corresponds to *unhandled user-defined exception*, then the <condition name> of the user-defined exception.
- ii) Otherwise, a zero-length string.
- If FI indicates ROW\_NUMBER, then the value retrieved is the number of the row in the rowset to which this status record corresponds. If the status record does not correspond to any particular row, then the value retrieved is 0 (zero).
- m) If FI indicates COLUMN\_NUMBER, then the value retrieved is the number of the column to which this status record corresponds. If the status record does not correspond to any particular column, then the value retrieved is 0 (zero).
- n) If *De* indicates an implementation-defined diagnostics status field, then the value retrieved is the value of the implementation-defined diagnostics status field.
- 13) Let V be the value retrieved.
- 14) If *DI* indicates a diagnostics field whose row in Table 1, "Header fields in SQL/CLI diagnostics areas" or Table 2, "Status record fields in SQL/CLI diagnostics areas", contains a Data Type that is neither CHARACTER nor CHARACTER VARYING, then DiagInfo is set to *V* and no further rules of this Subclause are applied.
- 15) Let *BL* be the value of BufferLength.

- 16) If BL is not greater than zero, then an exception condition is raised: CLI-specific condition invalid string length or buffer length.
- 17) Let L be the length in octets of V.
- 18) If StringLength is not a null pointer, then StringLength is set to L.
- 19) Case:
  - a) If null termination is *False* for the current SQL-environment, then

#### Case:

- If L is not greater than BL, then the first L octets of DiagInfo are set to V and the values of the i) remaining octets of DiagInfo are implementation-dependent.
- ii) Otherwise, DiagInfo is set to the first *BL* octets of *V*.
- Otherwise, let k be the number of octets in a null terminator in the character set of DiagInfo and let the phrase "implementation-defined null character that terminates a Character string" imply k octets, all of whose bits are 0 (zero).

- If L is not greater than (BL-k), then the first (L+k) octets of DiagInfo are set to V concatenated i) with a single implementation-defined null character that terminates a C character string. The values of the remaining characters of DiagInfo are implementation-dependent.
- Otherwise, DiagInfo is set to the first (BL-k) octets of V concatenated with a single implemenii) tation-defined null character that terminates a C character string.

### 6.34 GetDiagRec

### **Function**

Get commonly-used information from a CLI diagnostics area.

### **Definition**

```
JE 01/1501/1EC 9015-3:2016
GetDiagRec (
   HandleType
                         ΤN
                                   SMALLINT,
                                    INTEGER,
    Handle
                         IN
    RecordNumber
                         IN
                                    SMALLINT,
    Salstate
                         OUT
                                   CHARACTER(5),
   NativeError
                         OUT
                                    INTEGER.
                                    CHARACTER(L),
   MessageText
                         OUT
    BufferLength
                         IN
                                    SMALLINT.
                                   SMALLINT )
    TextLength
                         OUT
    RETURNS SMALLINT
```

where L has a maximum value equal to the implementation-defined maximum length of a variable-length JIEW the full character string.

### **General Rules**

- 1) Let HT be the value of HandleType.
- 2) If HT is not one of the code values in Table 4, "Codes used for SQL/CLI handle types", then an exception condition is raised: *CLI-specific condition* — invalid handle.
- 3) Case:
  - a) If HT indicates ENVIRONMENT HANDLE and Handle does not identify an allocated SQL-environment, then an exception condition is raised: CLI-specific condition — invalid handle.
  - b) If HT indicates CONNECTION HANDLE and Handle does not identify an allocated SQL-connection, then an exception condition is raised: *CLI-specific condition* — invalid handle.
  - c) If HT indicates STATEMENT HANDLE and Handle does not identify an allocated SQL-statement, then an exception condition is raised: *CLI-specific condition* — invalid handle.
  - d) If HT indicates DESCRIPTOR HANDLE and Handle does not identify an allocated CLI descriptor area, then an exception condition is raised: *CLI-specific condition* — invalid handle.
- 4) Let *RN* be the value of RecordNumber.
- 5) Let R be the most recently executed CLI routine, other than GetDiagRec, GetDiagField, or Error, for which Handle was passed as the value of an input handle and let N be the number of status records generated by the execution of R.

NOTE 47 — The GetDiagRec, GetDiagField, and Error routines may cause exception or completion conditions to be raised, but they do not cause diagnostic information to be generated.

6) If RN is less than 1 (one), then an exception condition is raised: invalid condition number.

- 7) If *RN* is greater than *N*, then a completion condition is raised: *no data*, and no further rules of this Subclause are applied.
- 8) Let *BL* be the value of BufferLength.
- 9) Information from the *RN*-th status record in the diagnostics area associated with the resource identified by Handle is retrieved.
  - a) If Sqlstate is not a null pointer, then Sqlstate is set to the SQLSTATE value corresponding to the status condition.
  - b) If NativeError is not a null pointer, then NativeError is set to the implementation-defined native error code corresponding to the status condition.
  - c) If MessageText is not a null pointer, then

#### Case:

- i) If null termination is <u>False</u> for the current SQL-environment and <u>BL</u> is zero, then no further rules of this Subclause are applied.
- ii) Otherwise, an implementation-defined character string is retrieved. Let *MT* be the implementation-defined character string that is retrieved and let *L* be the length in octets of *MT*. If *BL* is not greater than zero, then an exception condition is raised: *CLI-specific condition invalid string length or buffer length*. If TextLength is not a null pointer, then TextLength is set to *L*.

#### Case:

1) If null termination is *False* for the ourrent SQL-environment, then

### Case:

- A) If L is not greater than BL, then the first L octets of MessageText are set to MT and the values of the remaining octets of MessageText are implementation-dependent.
- B) Otherwise, Message Text is set to the first *BL* octets of *MT*.
- 2) Otherwise, let *k* the number of octets in a null terminator in the character set of MessageText and let the phrase "implementation-defined null character that terminates a C character string" imply *k* octets, all of whose bits are 0 (zero).

#### Case:

- A) If *L* is not greater than (*BL-k*), then the first (*L+k*) octets of MessageText are set to *MT* concatenated with a single implementation-defined null character that terminates a C character string. The values of the remaining characters of MessageText are implementation-dependent.
- B) Otherwise, MessageText is set to the first (*BL*–*k*) octets of *MT* concatenated with a single implementation-defined null character that terminates a C character string.

NOTE 48 — An implementation may provide <space>s or a zero-length string or a character string that describes the status condition.

### 6.35 GetEnvAttr

### **Function**

Get the value of an SQL-environment attribute.

### **Definition**

```
GetEnvAttr (
   EnvironmentHandle
                         TN
                                    INTEGER,
    Attribute
                         IN
                                    INTEGER,
    Value
                         OUT
                                    ANY,
    BufferLength
                         IN
                                    INTEGER.
                                    INTEGER )
    StringLength
                         OUT
    RETURNS SMALLINT
```

### **General Rules**

- 1) Case:
  - a) If EnvironmentHandle does not identify an allocated SQL-environment or if it identifies an allocated skeleton SQL-environment, then an exception condition is raised: *CLI-specific condition invalid handle*.
  - b) Otherwise:
    - i) Let *E* be the allocated SQL-environment identified by EnvironmentHandle.
    - ii) The diagnostics area associated with E is emptied.
- 2) Let *A* be the value of Attribute.
- 3) If A is not one of the code values in Table 16, "Codes used for environment attributes", then an exception condition is raised: *CLL-specific condition invalid attribute identifier*.
- 4) If A indicates NULL TERMINATION, then

#### Case:

- a) If null termination for E is <u>True</u>, then Value is set to 1 (one).
- b) If null termination for E is <u>False</u>, then Value is set to 0 (zero).
- 5) If Aspecifies an implementation-defined environment attribute, then

- a) If the data type for the environment attribute is specified in Table 20, "Data types of attributes", as INTEGER, then Value is set to the value of the implementation-defined environment attribute.
- b) Otherwise:
  - i) Let *BL* be the value of BufferLength.

- ii) Let AV be the value of the implementation-defined environment attribute.
- iii) The General Rules of Subclause 5.14, "Character string retrieval", are applied with Value, *AV*, *BL*, and StringLength as *TARGET*, *VALUE*, *TARGET OCTET LENGTH*, and *RETURNED OCTET LENGTH*, respectively.

### 6.36 GetFeatureInfo

### **Function**

Get information about features supported by the CLI implementation.

### **Definition**

```
GetFeatureInfo (
   ConnectionHandle
                        TN
                                  INTEGER,
                                  CHARACTER(L1),
   FeatureType
                        IN
   FeatureTypeLength
                        IN
                                  SMALLINT,
   FeatureId
                        TN
                                  CHARACTER(L2).
   FeatureIdLength
                        IN
                                  SMALLINT,
                                  CHARACTER(L3),
   SubFeatureId
                        IN
   SubFeatureIdLength
                                  SMALLINT,
                        IN
                                  SMALLINT )
                        OUT
   Supported
   RETURNS SMALLINT
```

where *L1*, *L2*, and *L3* has a maximum value equal to the implementation-defined maximum length of a variable-length character string.

### **General Rules**

- 1) Case:
  - a) If ConnectionHandle does not identify an allocated SQL-connection, then an exception condition is raised: *CLI-specific condition*—*invalid handle*.
  - b) Otherwise:
    - i) Let C be the allocated SQL-connection identified by ConnectionHandle.
    - ii) The diagnostics area associated with C is emptied.
- 2) Case:
  - a) If there is no established SQL-connection associated with *C*, then an exception condition is raised: connection exception connection does not exist.
  - b) Otherwise, let EC be the established SQL-connection associated with C.
- 3) If EC is not the current SQL-connection, then the General Rules of Subclause 5.3, "Implicit set connection", are applied with EC as *dormant SQL-connection*.
- 4) Let *FTL* be the value of FeatureTypeLength.
- 5) Case:
  - a) If FTL is not negative, then let L be FTL.
  - b) If *FTL* indicates NULL TERMINATED, then let *L* be the number of octets of Feature Type that precede the implementation-defined null character that terminates a C character string.

- c) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.
- 6) Case:
  - a) If *L* is zero, then an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.
  - b) Otherwise, let FTV be the first L octets of FeatureType and let FT be the value of

```
TRIM ( BOTH ' ' FROM 'FTV' )
```

- 7) If FT is other than 'FEATURE' or 'SUBFEATURE', then an exception condition is raised. CLI-specific condition invalid attribute value.
- 8) Let *FIL* be the value of FeatureIdIdLength.
- 9) Case:
  - a) If FIL is not negative, then let L be FIL.
  - b) If *FIL* indicates NULL TERMINATED, then let *L* be the number of octets of FeatureId that precede the implementation-defined null character that terminates a C character string.
  - c) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.
- 10) Case:
  - a) If *L* is zero, then an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.
  - b) Otherwise, let FIV be the first L octets of FeatureId and let FI be the value of

```
TRIM ( BOTH ' ' FROM 'FIV'
```

- 11) Case:
  - a) If FT is 'SUBFEATURE', then:
    - i) Let SFIL be the value of SubFeatureIdLength.
    - ii) Case:

If SFIL is not negative, then let L be SFIL.

- 2) If *SFIL* indicates NULL TERMINATED, then let *L* be the number of octets of SubFeatureId that precede the implementation-defined null character that terminates a C character string.
- 3) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.
- iii) Case:
  - 1) If *L* is zero, then an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.
  - 2) Otherwise, let SFIV be the first L octets of SubFeatureId and let SFI be the value of

```
TRIM ( BOTH ' ' FROM 'SFIV' )
```

- b) Otherwise, let SFI be a character string consisting of a single space.
- 12) If there is no row in the INFORMATION\_SCHEMA.SQL\_FEATURES view with TYPE equal to *FT*, FEATURE\_ID equal to *FI*, and SUB\_FEATURE\_ID equal *SFI*, then an exception condition is raised: *CLI-specific condition invalid attribute value*.
- 13) Let SH be an allocated statement handle on C.
- 14) Let *STMT* be the character string:

```
SELECT IS_SUPPORTED

FROM INFORMATION_SCHEMA.SQL_FEATURES

WHERE FEATURE_SUBFEATURE_PACKAGE_CODE = 'FT'

AND FEATURE_ID = 'FI'

AND SUB_FEATURE_ID = 'SFI'
```

- 15) Let *IS* be the single column value returned by the implicit invocation of ExecDirect with *SH* as the value of StatementHandle, *STMT* as the value of TextLength.
- 16) If any status condition, such as connection failure, is caused by the implicit execution of ExecDirect, then:
  - a) The status records returned by ExecDirect are returned on ConnectionHandle.
  - b) This invocation of GetFeatureInfo returns the same return code that was returned by the implicit invocation of ExecDirect and no further Rules of this Subclause are applied.
- 17) If the value of IS is 'YES', then Supported is set to 1 (one); otherwise, Supported is set to 0 (zero).

### **6.37** GetFunctions

### **Function**

Determine whether a CLI routine is supported.

### **Definition**

```
GetFunctions (
ConnectionHandle IN INTEGER,
FunctionId IN SMALLINT,
Supported OUT SMALLINT)
RETURNS SMALLINT
```

### **General Rules**

- 1) Case:
  - a) If ConnectionHandle does not identify an allocated SQL connection, then an exception condition is raised: *CLI-specific condition invalid handle*.
  - b) Otherwise:
    - i) Let C be the allocated SQL-connection identified by ConnectionHandle.
    - ii) The diagnostics area associated with C is emptied.
- 2) Case:
  - a) If there is no established SQL-connection associated with *C*, then an exception condition is raised: *connection exception connection does not exist*.
  - b) Otherwise, let EC be the established SQL-connection associated with C.
- 3) If EC is not the current SQL-connection, then the General Rules of Subclause 5.3, "Implicit set connection", are applied with EC as dormant SQL-connection.
- 4) Let *FI* be the value of FunctionId.
- 5) If FI is not one of the codes in Table 28, "Codes used to identify SQL/CLI routines", then an exception condition is raised: CLI-specific condition invalid FunctionId specified.
- 6) If *El* identifies a CLI routine that is supported by the implementation, then Supported is set to 1 (one); otherwise, Supported is set to 0 (zero). Table 28, "Codes used to identify SQL/CLI routines", specifies the codes used to identify the CLI routines defined in this part of ISO/IEC 9075.

### 6.38 GetInfo

This Subclause is modified by Subclause 20.3, "GetInfo", in ISO/IEC 9075-9.

### **Function**

Get information about the implementation.

### **Definition**

```
GetInfo (
    ConnectionHandle
                             IN
                                      INTEGER,
    InfoType
                             IN
                                      SMALLINT,
    InfoValue
                             OUT
                                      ANY,
    BufferLength
                             IN
                                      SMALLINT,
    StringLength
                             OUT
                                      SMALLINT )
    RETURNS SMALLINT
```

### General Rules

- 1) Case:
- ad s. If ConnectionHandle does not identify an allocated SQL-connection, then an exception condition is raised: *CLI-specific condition* — invalid handle.
  - Otherwise:
    - Let C be the allocated SQL connection identified by ConnectionHandle. i)
    - The diagnostics area associated with C is emptied. ii)
- 2) Case:
  - If there is no established SQL-connection associated with C, then an exception condition is raised: connection exception — connection does not exist.
  - b) Otherwise, let EC be the established SQL-connection associated with C.
- If EC is not the current SQL-connection, then the General Rules of Subclause 5.3, "Implicit set connection", are applied with EC as dormant SQL-connection.
- Several General Rules in this Subclause cause implicit invocation of ExecDirect. If any status condition, such as a connection failure, is caused by such implicit invocation of ExecDirect, then:
  - The status records returned by ExecDirect are returned on ConnectionHandle.
  - This invocation of GetInfo returns the same return code that was returned by the implicit invocation of ExecDirect and no further Rules of this Subclause are applied.
- 5) Let *IT* be the value of InfoType.
- If IT is not one of the codes in Table 29, "Codes and data types for implementation information", then an exception condition is raised: CLI-specific condition — invalid information type.

- 7) Let SS be the SQL-server associated with EC.
- 8) Refer to a component of the SQL-client that is responsible for communicating with one or more SQL-servers as a driver.
- 9) Let SH be an allocated statement handle on C.
- 10) OG Case:
  - a) If *IT* indicates any of the following:
    - MAXIMUM COLUMN NAME LENGTH
    - MAXIMUM COLUMNS IN GROUP BY
    - MAXIMUM COLUMNS IN ORDER BY
    - MAXIMUM COLUMNS IN SELECT
    - MAXIMUM COLUMNS IN TABLE
    - MAXIMUM CONCURRENT ACTIVITIES
    - MAXIMUM CURSOR NAME LENGTH
    - MAXIMUM DRIVER CONNECTIONS
    - MAXIMUM IDENTIFIER LENGTH
    - MAXIMUM SCHEMA NAME LENGTH
    - MAXIMUM STATEMENT OCTETS DATA
    - MAXIMUM STATEMENT OCTETS SCHEMA
    - MAXIMUM STATEMENT OCTETS
    - MAXIMUM TABLE NAME LENGTH
    - MAXIMUM TABLES IN SELECT
    - MAXIMUM USER NAME LENGTH
    - MAXIMUM CATALOG NAME LENGTH

then:

i) Let STMT be the character string;

```
SELECT SUPPORTED_VALUE FROM INFORMATION_SCHEMA.SQL_SIZING WHERE SIZING_ID = IT
```

- ii) Let *V* be the single column value returned by the implicit invocation of ExecDirect with *SH* as the value of StatementHandle, *STMT* as the value of StatementText, and the length of *STMT* as the value of TextLength.
- b) If *IT* indicates any of the following:
  - CATALOG NAME

### ISO/IEC 9075-3:2016(E) 6.38 GetInfo

- COLLATING SEQUENCE
- CURSOR COMMIT BEHAVIOR
- DATA SOURCE NAME
- DBMS NAME
- DBMS VERSION
- NULL COLLATION
- SEARCH PATTERN ESCAPE
- SERVER NAME
- SPECIAL CHARACTERS

then:

i) Let *STMT* be the character string;

```
of 15011EC 9015-3:2016
FROM INFORMATION_SCHEMA.SQL_IMPLEMENTATION_INFO
WHERE IMPLEMENTATION_INFO_ID = IT
```

- Let V be the single column value returned by the implicit invocation of ExecDirect with SH as ii) the value of StatementHandle, STMT as the value of StatementText, and the length of STMT as the value of TextLength.
- If *IT* indicates any of the following:
  - DEFAULT TRANSACTION ISOLATION
  - **IDENTIFIER CASE**
  - TRANSACTION CAPABLE

then:

Let STMT be the character string; i)

```
SELECT INTEGER_VALUE
FROM INFORMATION SCHEMA.SQL IMPLEMENTATION INFO
WHERE IMPLEMENTATION_INFO_ID = IT
```

- Let V be the single column value returned by the implicit invocation of ExecDirect with SH as the value of StatementHandle, STMT as the value of StatementText, and the length of STMT as the value of TextLength.
- If  $IT \ge 21000$  and  $IT \le 24999$ , or if  $IT \ge 11000$  and  $IT \le 14999$ , then:
  - Let *STMT* be the character string; i)

```
SELECT COALESCE (CHARACTER_VALUE, INTEGER_VALUE)
FROM INFORMATION_SCHEMA.SQL_IMPLEMENTATION_INFO
WHERE IMPLEMENTATION_INFO_ID = IT
```

- Let V be the single column value returned by the implicit invocation of ExecDirect with SH as ii) the value of StatementHandle, STMT as the value of StatementText, and the length of STMT as the value of TextLength.
- If  $IT \ge 25000$  and  $IT \le 29999$ , or if  $IT \ge 15000$  and  $IT \le 19999$ , then:
  - i) Let *STMT* be the character string;

```
SELECT SUPPORTED VALUE
FROM INFORMATION SCHEMA. SOL SIZING
WHERE IMPLEMENTATION_INFO_ID = IT
```

- Let V be the single column value returned by the implicit invocation of Executive with SH as ii) the value of StatementHandle, STMT as the value of StatementText, and the length of STMT as the value of TextLength.
- 11) Let *BL* be the value of BufferLength.
- 12) Case:
  - a) If the data type of V is character string, then the General Rules of Subclause 5.14, "Character string ongl.

    Tandards 150. Com. Cick to view the full of the retrieval", are applied with InfoValue, V, BL, and StringLength as TARGET, VALUE, TARGET

### 6.39 GetLength

### **Function**

Retrieve the length of the string value represented by a Large Object locator.

### **Definition**

GetLength(		
StatementHandle	IN	INTEGER,
LocatorType	IN	SMALLINT,
Locator	IN	INTEGER,
StringLength	OUT	INTEGER,
IndicatorValue	OUT	INTEGER )
RETURNS SMALLINT		

### **General Rules**

- \* of 1501/EC 9015-3:2016 1) Let S be the allocated SQL-statement identified by Statement Handle.
- 2) If there is a prepared statement associated with S, then an exception condition is raised: CLI-specific condition — function sequence error.
- 3) If the value of LocatorType is not that of either CHARACTER LARGE OBJECT LOCATOR or BINARY LARGE OBJECT LOCATOR from Table 8, "Codes used for application data types in SQL/CLI", then an exception condition is raised: *CLI-specific condition* — *invalid attribute value*.
- 4) Let *LL* be the Large Object locator value in Locator.
- 5) If LL is not a valid Large Object locator, then an exception condition is raised: locator exception invalid specification.
- 6) Let *TL* be the actual data type of the Large Object string on the server.
- 7) If the value of Locator Type is not consistent with TL (e.g., a CHARACTER LARGE OBJECT LOCATOR for a BINARY LARGE OBJECT value), then an exception condition is raised: dynamic SQL error restricted data type attribute violation.
- Let SV be the string value that is represented by LL.
- - a) SV contains the null value, then

Case:

- i) If IndicatorValue is a null pointer, then an exception condition is raised: data exception — null value, no indicator parameter.
- ii) Otherwise:

- ength is implementation-dependent.

  ength is implementation-dependent.

  ength is implementation-dependent.

  ength is set to 0 (zero).

  ength is set to the length in ength in If TL is CHARACTER LARGE OBJECT, then StringLength is set to the length in characters

### 6.40 GetParamData

### **Function**

Retrieve the value of a dynamic output parameter.

### **Definition**

```
GetParamData (
    StatementHandle
                         ΤN
                                    INTEGER.
                                    SMALLINT,
    ParameterNumber
                         IN
    TargetType
                         IN
                                    SMALLINT,
    TargetValue
                         OUT
                                    ANY.
                                    INTEGER.
    BufferLength
                         IN
    StrLen_or_Ind
                         OUT
                                    INTEGER )
    RETURNS SMALLINT
```

### **General Rules**

- OF of ISOILECOOTS, 3:2016 1) Let S be the allocated SQL-statement identified by StatementHandle.
- 2) If there is no executed SQL-statement associated with Sthen an exception condition is raised: CLI-specific condition — function sequence error; otherwise, let P be the SQL-statement that was prepared.
- 3) If P is not a <call statement>, then an exception condition is raised: CLI-specific condition function sequence error.
- 4) Let APD be the current application parameter descriptor for S and let N be the value of the TOP\_LEVEL\_COUNT field of APD;
- 5) If N is less than zero, then an exception condition is raised: dynamic SQL error invalid descriptor count.
- 6) Let PN be the value of ParameterNumber.
- 7) If PN is less than 1 (one) or greater than N, then an exception condition is raised: dynamic SOL error invalid descriptor index.
- 8) If DATA\_POINTER is non-zero for at least one of the first N item descriptor areas of APD for which the TYPE value is neither ROW, ARRAY, nor MULTISET, then let BPN be the parameter number associated with such at item descriptor area and let *HBPN* be the value of MAX(*BPN*). Otherwise, let *HBPN* be 0 (zero)
- 9) Let IDA be the item descriptor area of APD specified by PN. If the value of TYPE of IDA is either ROW, ARRAY, or MULTISET, or if LEVEL of *IDA* is greater than 0 (zero), then an exception condition is raised: dynamic SOL error — invalid descriptor index.

NOTE 49 — GetParamData cannot be called to retrieve the data corresponding to a subordinate descriptor record such as, for example, from an individual field of a ROW type.

- 10) Let *IDA1* be the item descriptor area of *IPD* specified by *PN*.
- 11) Let *PM* be the value of PARAMETER MODE in *IDA1*.

- 12) If *PM* is PARAM MODE IN then an exception condition is raised: *dynamic SQL error invalid descriptor index*.
- 13) If PN is not greater than HBPN, then

- a) If the DATA\_POINTER field of *IDA* is not zero, then an exception condition is raised: *dynamic SQL error invalid descriptor index*.
- b) If the DATA\_POINTER field of *IDA* is zero, then it is implementation-defined whether an exception condition is raised: *dynamic SQL error*—invalid descriptor index.
  - NOTE 50 This implementation-defined feature determines whether parameters before the highest bound parameter can be accessed by GetParamData.
- 14) If there is a fetched parameter number associated with *S*, then let *FPN* be that parameter number; otherwise, let *FPN* be zero.
  - NOTE 51 "fetched parameter number" is the ParameterNumber value used with the previous invocation (if any) of the GetParamData routine with S. See the General Rules later in this Subclause where this value is set.
- 15) Case:
  - a) If *FPN* is greater than zero and *PN* is not greater than *FPN*, then it is implementation-defined whether an exception condition is raised: *dynamic SQL error*—*invalid descriptor index*.
    - NOTE 52 This implementation-defined feature determines whether GetParam Data can only access parameters in ascending parameter number order.
  - b) If FPN is less than zero, then:
    - i) Let AFPN be the absolute value of FPN
    - ii) Case:
      - 1) If PN is less than AFPN, then it is implementation-defined whether an exception condition is raised: dynamic SQL error invalid descriptor index.
        - NOTE 53 This implementation-defined feature determines whether GetParamData can only access parameters in ascending parameter number order.
      - 2) If PN is greater than AFPN, then let FPN be AFPN.
- 16) Let *T* be the value of TargetType.
- 17) Let *HL* be the programming language of the invoking host program. Let *operative data type correspondence table* be the data type correspondence table for *HL* as specified in Subclause 5.20, "SQL/CLI data type correspondences". Refer to the two columns of the operative data type correspondence table as the *SQL data type column* and the *host data type column*.
- 18) If either of the following is true, then an exception condition is raised: *CLI-specific condition invalid data type in application descriptor*.
  - a) *T* indicates neither DEFAULT nor APD TYPE and is not one of the code values in Table 8, "Codes used for application data types in SQL/CLI".
  - b) *T* is one of the code values in Table 8, "Codes used for application data types in SQL/CLI", but the row that contains the corresponding SQL data type in the SQL data type column of the operative data type correspondence table contains 'None' in the host data type column.

### ISO/IEC 9075-3:2016(E) 6.40 GetParamData

- 19) If T does not indicate APD TYPE, then the data type of the <target specification > described by IDA is set
- 20) Let *IPD* be the implementation parameter descriptor associated with S.
- 21) If the value of the TYPE field of *IDA* indicates DEFAULT, then:
  - a) Let PT, P, and SC be the values of the TYPE, PRECISION, and SCALE fields, respectively, for the PN-th item descriptor area of IPD for which LEVEL is 0 (zero).
  - The data type, precision, and scale of the <target specification> described by IDA are set to PT, P, and SC, respectively, for the purposes of this GetParamData invocation only.
- 22) If IDA is not valid as specified in Subclause 5.18, "Description of CLI item descriptor areas", then an exception condition is raised: dynamic SQL error — using clause does not match target specifications.
- 23) Let TT be the value of the TYPE field of IDA.
- 24) Case:
  - a) If TT indicates CHARACTER, then:
    - Let UT be the code value corresponding to CHARACTER VARYING as specified in Table 7, "Codes used for implementation data types in SQUCLI".
    - Let CL be the implementation-defined maximum length for a CHARACTER VARYING data ii)
  - b) Otherwise, let *UT* be *TT* and let *CL* be zero.

    Case:

    a) If *FPN* is less than zero, then
- 25) Case:

Case:

- If TT does not indicate CHARACTER, CHARACTER LARGE OBJECT, BINARY, BINARY i) VARYING, or BINARY LARGE OBJECT, then AFPN becomes the fetched parameter number associated with S and an exception condition is raised: dynamic SQL error — invalid descriptor index.
- ii) Otherwise, let FL, DV, and DL be the fetched length, data value and data length, respectively, associated with FPN and let TV be the result of the <string value function>:

SUBSTRING (DV FROM (FL+1))

- Otherwise:
  - Let *FL* be zero.
  - Let SDT be the effective data type of the PCN-th <select list> column as represented by the values of the TYPE, LENGTH, PRECISION, SCALE, DATETIME\_INTERVAL\_CODE, DATETIME\_INTERVAL\_PRECISION, CHARACTER\_SET\_CATALOG, CHARAC-TER\_SET\_SCHEMA, CHARACTER\_SET\_NAME, USER\_DEFINED\_TYPE\_CATALOG, USER DEFINED TYPE SCHEMA, and USER DEFINED TYPE NAME fields in the PN-th item descriptor area of IPD. Let SV be the value of the parameter, with data type SDT.

- iii) Let *TDT* be the effective data type of the *PN*-th <target specification> as represented by the type *UT*, the length value *CL*, and the values of the PRECISION, SCALE, CHARACTER\_SET\_CATALOG, CHARACTER\_SET\_SCHEMA, CHARACTER\_SET\_NAME, USER\_DEFINED\_TYPE\_CATALOG, USER\_DEFINED\_TYPE\_SCHEMA, and USER DEFINED TYPE NAME fields of *IDA*.
- iv) Case:
  - 1) If *TDT* is a locator type, then

Case:

- A) If SV is not the null value, then a locator L that uniquely identifies SV is generated and the value of TV of the i-th bound target is set to an implementation-dependent four-octet value that represents L.
- B) Otherwise, the value TV of the PN-th < target specification > is the null value.
- 2) If SDT and TDT are predefined data types, then

Case:

A) If the <cast specification>

```
CAST ( SV AS TDT )
```

does not conform to the Syntax Rules of Subclause 6.13, "<cast specification>", in [ISO9075-2], and there is an implementation-defined conversion from type *SDT* to type *TDT*, then that implementation-defined conversion is effectively performed, converting *SV* to type *TDT*, and the result is the value *TV* of the *PN*-th <target specification>.

- B) Otherwise:
  - I) If the <ast specification>

does not conform to the Syntax Rules of Subclause 6.13, "<cast specification>", in [ISO9075-2], then an exception condition is raised: *dynamic SQL error*—
restricted data type attribute violation.

II) The <cast specification>

```
CAST ( SV AS TDT )
```

is effectively performed, and is the value TV of the PN-th <target specification>.

- 3) If *SDT* is a user-defined type and *TDT* is a predefined data type, then:
  - A) Let DT be the data type identified by SDT.
  - B) If the current SQL-session has a group name corresponding to the user-defined name of *DT*, then let *GN* be that group name; otherwise, let *GN* be the default transform group name associated with the current SQL-session.
  - C) The Syntax Rules of Subclause 9.25, "Determination of a from-sql function", in [ISO9075-2], are applied with *DT* and *GN* as *TYPE* and *GROUP*, respectively.

### ISO/IEC 9075-3:2016(E) 6.40 GetParamData

#### Case:

I) If there is an applicable from-sql function, then let FSF be that from-sql function and let *FSFRT* be the <returns data type> of *FSF*.

#### Case:

- 1) If FSFPT is compatible with TDT, then the from-sql function TSF is effectively invoked with SV as its input parameter and the <return value> is the value TV of the CN-th <target specification>.
- 2) Otherwise, an exception condition is raised: dynamic SQLerror restricted data type attribute violation.
- Otherwise, an exception condition is raised: dynamic SQL error II) transform function violation.
- 26) PN becomes the fetched parameter number associated with S.
- 27) If TV is the null value, then

#### Case:

- a) If StrLen\_or\_Ind is a null pointer, then an exception condition is raised: data exception null value, no indicator parameter.
- b) Otherwise, StrLen or Ind is set to the appropriate 'Code' for SQL NULL DATA in Table 27, "Miscellaneous codes used in CLI', and the value of TargetValue is implementation-dependent.
- 28) Let *OL* be the value of BufferLength.
- 29) If null termination is <u>True</u> for the current <u>SQL</u>-environment, then let NB be the length in octets of a null terminator in the character set of the *i*-th bound target; otherwise let NB be 0 (zero).
- 30) If TV is not the null value, then:
  - StrLen or Ind is set to 0 (zero).
  - b) Case:
    - i) If TT does not indicate CHARACTER, CHARACTER LARGE OBJECT, BINARY, BINARY VARYING, or BINARY LARGE OBJECT, then TargetValue is set to TV.
    - Otherwise: ii)

## If TT is CHARACTER or CHARACTER LARGE OBJECT, then:

- A) If TV is a zero-length character string, then it is implementation-defined whether or not an exception condition is raised: data exception — zero-length character string.
- B) The General Rules of Subclause 5.14, "Character string retrieval", are applied with Target Value, TV, OL, and StrLen\_or\_Ind as TARGET, VALUE, OCTET LENGTH, and RETURNED OCTET LENGTH, respectively.
- 2) If TT is BINARY, BINARY VARYING, or BINARY LARGE OBJECT, then the General Rules of Subclause 5.15, "Binary string retrieval", are applied with TargetValue, TV, OL, and StrLen\_or\_Ind as TARGET, VALUE, OCTET LENGTH, and RETURNED OCTET *LENGTH*, respectively.

- If FCN is not less than zero, then let DV be TV and let DL be the length of TV in octets.
- Let FL be (FL+OL-NB).
- 5) If FL is less than DL, then –PN becomes the fetched parameter number associated with the fetched parameter associated with S and FL, DV and DL become the fetched length, data value, and data length, respectively, associated with the fetched parameter number.

ad let eter num. eter num.

### 6.41 GetPosition

### **Function**

Retrieve the starting position of a string value within another string value, where the second string value is Atte represented by a Large Object locator.

### **Definition**

GetPosition(		
StatementHandle	IN	INTEGER,
LocatorType	IN	SMALLINT,
SourceLocator	IN	INTEGER,
SearchLocator	IN	INTEGER,
SearchLiteral	IN	ANY,
SearchLiteralLength	IN	INTEGER,
FromPosition	IN	INTEGER,
LocatedAt	OUT	INTEGER,
IndicatorValue	OUT	INTEGER )
RETURNS SMALLINT		

### **General Rules**

- 1) Let S be the allocated SQL-statement identified by StatementHandle.
- 2) If there is a prepared statement associated with S, then an exception condition is raised: CLI-specific condition — function sequence error.
- 3) If the value of LocatorType is not that of either CHARACTER LARGE OBJECT LOCATOR or BINARY LARGE OBJECT LOCATOR from Table 8, "Codes used for application data types in SQL/CLI", then an exception condition is raised CLI-specific condition — invalid attribute identifier.
- 4) Let SRCL be the Large Object locator value in SourceLocator.
- 5) If SRCL is not a valid Large Object locator, then an exception condition is raised: locator exception invalid specification.
- 6) Let SRCT be the actual data type of the Large Object string on the server.
- If the value of LocatorType is not consistent with SRCT (e.g., a CHARACTER LARGE OBJECT LOCATOR for a BINARY LARGE OBJECT value), then an exception condition is raised: dynamic SQL error restricted data type attribute violation.
- 8) Case:
  - a) If SRCL represents the null value, then

### Case:

If IndicatorValue is a null pointer, then an exception condition is raised: data exception — null i) value, no indicator parameter.

- ii) Otherwise, IndicatorValue is set to the appropriate 'Code' for SQL NULL DATA in Table 27, "Miscellaneous codes used in CLI", the value of all other output arguments is implementation-dependent, and no further rules of this Subclause are applied.
- b) Otherwise:
  - i) Indicator Value is set to 0 (zero).
  - ii) Let SRCV be the actual value that is represented by SRCL.
- 9) Let *SLL* be the value of SearchLiteralLength.
- 10) Case:
  - a) If *SLL* is equal to zero, then:
    - i) Let SCHL be the Large Object locator value in SearchLocator.
    - ii) If SCHL is not a valid Large Object locator, then an exception condition is raised: locator exception invalid specification.
    - iii) Let SCHT be the actual data type of the Large Object string on the server.
    - iv) If the value of LocatorType is not consistent with *SCHT*, then an exception condition is raised: *dynamic SQL error restricted data type attribute violation*.
    - v) If SCHL represents the null value, then an exception condition is raised: CLI-specific condition—invalid attribute value.
    - vi) Let SCHV be the actual value that is represented by SCHL.
  - b) Otherwise,

Case:

- i) If SearchLiteral is a null pointer, then an exception condition is raised: *CLI-specific condition* invalid attribute value.
- ii) Otherwise, let **SCHV** be the value of that literal.
- 11) Let *FP* be the value of FromPosition. Let *SRCVL* be the length of *SRCV* (in characters if *SRCV* is a character string and in octets if *SRCV* is a binary string).
- 12) If FP is less than V (one) or greater than SRCVL, then an exception condition is raised: CLI-specific condition invalid attribute value.
- 13) If FP is greater than 1 (one), then let SRCV be the value of

SUBSTRING (SRCV FROM FP)

- 14) Case:
  - a) If *SRCV* contains a string *MV* of contiguous characters (if *SRCV* is a character string) or contiguous octets (if *SRCV* is a binary string) that is the same as the string of characters or octets (as appropriate) in *SCHV* then LocatedAt is set to the starting position (in characters or octets, as appropriate) of the first occurrence of *MV* within *SRCV*.
  - b) Otherwise, LocatedAt is set to 0 (zero).

### 6.42 GetSessionInfo

# **Function**

Get information about <general value specification>s supported by the implementation.

### **Definition**

GetSessionInfo(		
ConnectionHandle	IN	INTEGER,
InfoType	IN	SMALLINT,
InfoValue	OUT	ANY,
BufferLength	IN	SMALLINT,
StringLength	OUT	SMALLINT )
RETURNS SMALLINT		

- 1) Case:
  - a) If ConnectionHandle does not identify an allocated SQL-connection, then an exception condition is raised: *CLI-specific condition invalid handle*
  - b) Otherwise:
    - i) Let C be the allocated SQL-connection identified by ConnectionHandle.
    - ii) The diagnostics area associated with C is emptied.
- 2) Case:
  - a) If there is no established SQL-connection associated with *C*, then an exception condition is raised: connection exception—connection does not exist.
  - b) Otherwise, let EC be the established SQL-connection associated with C.
- 3) If EC is not the current SQL-connection, then the General Rules of Subclause 5.3, "Implicit set connection", are applied with EC as dormant SQL-connection.
- 4) Let *IT* be the value of InfoType.
- 5) If *IT* is not one of the codes in Table 30, "Codes and data types for session implementation information", then an exception condition is raised: *CLI-specific condition invalid information type*.
- 6) Let GVS be the value of <general value specification> in the same row as IT in Table 30, "Codes and data types for session implementation information".
- 7) Let SH be an allocated statement handle on C.
- 8) Let *STMT* be the character string:

```
SELECT UNIQUE GVS
```

```
FROM INFORMATION_SCHEMA.TABLES - Any table would do
WHERE 1 = 1 - Any predicate that is TRUE would do
```

- 9) *V* is set to the single column value returned by the implicit invocation of ExecDirect with *SH* as the value of StatementHandle, *STMT* as the value of StatementText, and the length of *STMT* as the value of TextLength.
- 10) If any status condition, such as connection failure, is caused by the implicit invocation of ExecDirect, then:
  - a) The status records returned by ExecDirect on SH are returned on ConnectionHandle.
  - b) This invocation of GetSessionInfo returns the same return code that was returned by the implicit invocation of ExecDirect and no further Rules of this Subclause are applied.
- 11) Let *BL* be the value of BufferLength.
- 12) The General Rules of Subclause 5.14, "Character string retrieval", are applied with InfoValue, V, BL, and StringLength as TARGET, VALUE, TARGET OCTET LENGTH, and RETURNED OCTET LENGTH, respectively.

### 6.43 GetStmtAttr

# **Function**

Get the value of an SQL-statement attribute.

### **Definition**

```
GetStmtAttr (
    StatementHandle
                         ΤN
                                   INTEGER,
    Attribute
                         IN
                                   INTEGER,
    Value
                         OUT
                                   ANY,
    BufferLength
                         IN
                                   INTEGER,
    StringLength
                         OUT
                                    INTEGER )
    RETURNS SMALLINT
```

# **General Rules**

- 1) Let S be the allocated SQL-statement identified by Statement Handle.
- 2) Let A be the value of Attribute.
- 3) If A is not one of the code values in Table 18, "Codes used for statement attributes", then an exception condition is raised: *CLI-specific condition invalid attribute identifier*.
- 4) Case:
  - a) If *A* indicates APD\_HANDLE, then Value is set to the handle of the current application parameter descriptor for *S*.
  - b) If A indicates ARD\_HANDLE, then Value is set to the handle of the current application row descriptor for S.
  - c) If *A* indicates IPD\_HANDLE, then Value is set to the handle of the implementation parameter descriptor associated with *S*.
  - d) If A indicates IRD\_HANDLE, then Value is set to the handle of the implementation row descriptor associated with S.
  - e) If A indicates CURSOR SCROLLABLE, then
    - Case:
    - i) If the implementation supports CLI scrollable cursors, then

### Case:

1) If the value of the CURSOR SCROLLABLE attribute of *S* is NONSCROLLABLE, then Value is set to the code value for NONSCROLLABLE from Table 27, "Miscellaneous codes used in CLI".

- 2) If the value of the CURSOR SCROLLABLE attribute of *S* is SCROLLABLE, then Value is set to the code value for SCROLLABLE from Table 27, "Miscellaneous codes used in CLI".
- ii) Otherwise, an exception condition is raised: *CLI-specific condition optional feature not implemented*.
- f) If A indicates CURSOR SENSITIVITY, then

Case:

i) If the implementation supports CLI cursor sensitivity, then

Case:

- 1) If the value of the CURSOR SENSITIVITY attribute of S is ASENSITIVE, then Value is set to the code value for ASENSITIVE from Table 27, "Miscellaneous codes used in CLI".
- 2) If the value of the CURSOR SENSITIVITY attribute of Sis INSENSITIVE, then Value is set to the code value for INSENSITIVE from Table 27. 'Miscellaneous codes used in CLI'.
- 3) If the value of the CURSOR SENSITIVITY attribute of *S* is SENSITIVE, then Value is set to the code value for SENSITIVE from Table 27, "Miscellaneous codes used in CLI".
- ii) Otherwise, an exception condition is raised: \*\*CM-specific condition optional feature not implemented.
- g) If A indicates METADATA ID, then

Case:

- i) If the METADATA ID attribute for *S* has been set by the SetStmtAttr routine, then Value is set to the code value of that attribute from Table 20, "Data types of attributes".
- ii) Otherwise, Value is set to the code value for FALSE from Table 27, "Miscellaneous codes used in CLI".
- h) If A indicates CURSOR HOLDABLE, then

Case:

i) If the implementation supports CLI cursor sensitivity, then

- 1) If the value of the CURSOR HOLDABLE attribute of *S* is NONHOLDABLE, then the Value is set to the code value for NONHOLDABLE from Table 27, "Miscellaneous codes used in CLI".
- 2) If the value of the CURSOR HOLDABLE attribute of *S* is HOLDABLE, then the Value is set to the code value for HOLDABLE from Table 27, "Miscellaneous codes used in CLI".
- 3) Otherwise, an exception condition is raised: *CLI-specific condition invalid attribute value*.

# ISO/IEC 9075-3:2016(E) 6.43 GetStmtAttr

- ii) Otherwise, an exception condition is raised: *CLI-specific condition optional feature not implemented*.
- i) If A indicates CURRENT OF POSITION, then

### Case:

- i) If there is no fetched rowset associated with *S*, then an exception condition is raised: *CLI-specific condition invalid cursor state*.
- ii) Otherwise, Value is set to the current position within the fetched rowset associated with S.
- j) If A indicates NEST DESCRIPTOR, then

### Case:

- i) If the NEST DESCRIPTOR attribute for S has been set by the SetStmtAttr routine, then Value is set to the code value of that attribute from Table 20, "Data types of attributes".
- ii) Otherwise, VALUE is set to the code value for FALSE from Pable 27, "Miscellaneous codes used in CLI".
- 5) If A specifies an implementation-defined statement attribute, then

- a) If the data type for the statement attribute is specified in Table 20, "Data types of attributes", as INTEGER, then Value is set to the value of the implementation-defined statement attribute.
- b) Otherwise:
  - i) Let *BL* be the value of BufferLength.
  - ii) Let AV be the value of the implementation-defined statement attribute.
  - iii) The General Rules of Subclause 5.14, "Character string retrieval", are applied with Value, AV, BL, and StringLength as TARGET, VALUE, TARGET OCTET LENGTH, and RETURNED OCTET LENGTH, respectively.

# 6.44 GetSubString

### **Function**

3Mthe full PDF of ISOILEC 9015.3:2016 Either retrieve a portion of a string value that is represented by a Large Object locator or create a Large Object value at the server and retrieve a Large Object locator for that value.

# **Definition**

GetSubString(		
StatementHandle	IN	INTEGER,
LocatorType	IN	SMALLINT,
SourceLocator	IN	INTEGER,
FromPosition	IN	INTEGER,
ForLength	IN	INTEGER,
TargetType	IN	SMALLINT,
TargetValue	OUT	ANY,
BufferLength	IN	INTEGER,
StringLength	OUT	INTEGER,
IndicatorValue	OUT	INTEGER )
RETURNS SMALLINT		

- 1) Let S be the allocated SQL-statement identified by StatementHandle.
- 2) If there is a prepared statement associated with S, then an exception condition is raised: CLI-specific condition — function sequence error.
- 3) If the value of LocatorType is not that of either CHARACTER LARGE OBJECT LOCATOR or BINARY LARGE OBJECT LOCATOR from Table 8, "Codes used for application data types in SQL/CLI", then an exception condition is raised: *CLI-specific condition* — *invalid attribute value*.
- 4) Let *SRCL* be the Large Object locator value in SourceLocator.
- 5) If SRCL is not a valid Large Object locator, then an exception condition is raised: locator exception invalid specification.
- 6) Let SRCT be the actual data type of the Large Object string on the server.
- 7) If the value of LocatorType is not consistent with SRCT (e.g., a CHARACTER LARGE OBJECT LOCATOR for a BINARY LARGE OBJECT value), then an exception condition is raised: dynamic SQL error — restricted data type attribute violation.
- 8) Let TT be the value of TargetType.
- 9) If TT is not equal to one of the values for CHARACTER, CHARACTER LARGE OBJECT, BINARY, BINARY VARYING, BINARY LARGE OBJECT, CHARACTER LARGE OBJECT LOCATOR, or BINARY LARGE OBJECT LOCATOR from Table 8, "Codes used for application data types in SQL/CLI", then an exception condition is raised: *CLI-specific condition* — *invalid attribute value*.
- 10) If SRCL is the null value, then

# ISO/IEC 9075-3:2016(E) 6.44 GetSubString

- a) If Indicator Value is a null pointer, then an exception condition is raised: *data exception null value*, *no indicator parameter*.
- b) Otherwise, IndicatorValue is set to the value of the 'Code' for SQL NULL DATA from Table 27, "Miscellaneous codes used in CLI", the values of all other output arguments are implementation-dependent, and no further rules of this Subclause are applied.
- 11) Let *OL* be the value of BufferLength.
- 12) If SRCL is not the null value, then:
  - a) IndicatorValue is set to 0 (zero).
  - b) Let SRCV be the large object value that is represented by SRCL.
  - c) If *SRCV* is a character string, then let *SRCVL* be the length of *SRCV* in characters; if *SRCV* is a binary string, then let *SRCVL* be the length of *SRCV* in octets.
  - d) Let FP be the value of FromPosition and let FL be the value of ForLength.
  - e) If any of the following is true, then an exception condition is raised: *CLI-specific condition invalid attribute value*.
    - i) FP is less than 1 (one).
    - ii) FL is less than 1 (one).
    - iii) FP+FL-1 is greater than SRCVL.
  - f) Let RV be the value of the string that starts at position FP and ends at position FP+FL-1 in SRCV (where the positions are in characters or octets, as appropriate).
  - g) Let *RVL* be the number of octets in *RV*.
  - h) Case:
    - i) If TT indicates CHARACTER or CHARACTER LARGE OBJECT, then:
      - 1) If TV is a zero-length character string, then it is implementation-defined whether or not an exception condition is raised: data exception zero-length character string.
      - 2) The General Rules of Subclause 5.14, "Character string retrieval", are applied with Target-Value, RV, OL, and RVL as TARGET, VALUE, OCTET LENGTH and RETURNED OCTET LENGTH, respectively.
    - If TT indicates BINARY, BINARY VARYING, or BINARY LARGE OBJECT, then the General Rules of Subclause 5.15, "Binary string retrieval", are applied with TargetValue, RV, OL, and RVL as TARGET, VALUE, OCTET LENGTH and RETURNED OCTET LENGTH, respectively.
    - iii) Otherwise, set TargetValue to the value of a Large Object locator that represents the value *RV* at the server.

# 6.45 GetTypeInfo

### **Function**

Get information about one or all of the predefined data types supported by the implementation.

- Let S be the allocated SQL-statement identified by StatementHandles

  1) Let S be the allocated SQL-statement identified by StatementHandles

  2) If an open CLI cursor is associated with S, then an exception conditions is not the code value corresponding and is not one of the code condition is raise. If D is not the code value corresponding to ALL TYPES in Table 27, "Miscellaneous codes used in CLI",
- 5) Let C be the allocated SQL-connection with which S is associated.
- 6) Let EC be the established SQL-connection associated with C and let SS be the SQL-server associated with
- 7) Let TYPE INFO be a table, with a definition and description as specified below, that contains a row for each predefined data type supported by SS. For all supported predefined data types for which more than one name is supported, it is implementation-defined whether TYPE\_INFO contains a single row or a row for each supported name.

```
CREATE TABLE TYPE_INFO (
    TYPE_NAME
                          CHARACTER VARYING(128) NOT NULL
      PRIMARY KEY,
    DATA_TYPE
COLUMN_SIZE
                         SMALLINT
                                                     NOT NULL,
                         INTEGER,
   LITERAL_PREFIX CHARACTER VARYING(128),
LITERAL_SUFFIX CHARACTER VARYING(128),
CREATE_PARAMS CHARACTER VARYING(128)
      CHARACTER SET SQL_TEXT,
    NULLABLE
                                                     NOT NULL
                         SMALLINT
      CHECK ( NULLABLE IN (0, 1, 2) ),
    CASE_SENSITIVE SMALLINT
                                                     NOT NULL
      CHECK ( CASE_SENSITIVE IN (0, 1) ),
                                                     NOT NULL
    SEARCHABLE
                  SMALLINT
      CHECK ( SEARCHABLE IN (0, 1, 2, 3) ),
    UNSIGNED_ATTRIBUTE SMALLINT
      CHECK ( UNSIGNED_ATTRIBUTE IN (0, 1)
```

### ISO/IEC 9075-3:2016(E) 6.45 GetTypeInfo

```
OR UNSIGNED_ATTRIBUTE IS NULL),
FIXED_PREC_SCALE SMALLINT NOT NULL
 CHECK ( FIXED_PREC_SCALE IN (0, 1)),

MINIMUM_SCALE INTEGER,
MAXIMUM_SCALE
                 INTEGER,
SQL_DATA_TYPE
                 SMALLINT
                                       NOT NULL,
SQL_DATETIME_SUB SMALLINT
 CHECK ( SQL_DATETIME_SUB IN
       (1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13)
       OR SQL_DATETIME_SUB IS NULL),
NUM_PREC_RADIX
              INTEGER,
INTERVAL_PRECISION SMALLINT )
```

- The description of the table TYPE\_INFO is:
  - The value of TYPE\_NAME is the name of the data type. If multiple names are supported for this data type and TYPE\_INFO contains only a single row for this data type, then it is implementation-defined which of the names is in TYPE\_NAME.
  - The value of DATA\_TYPE is the code value for the predefined data type as defined in Table 33, "Codes used for concise data types".
  - The value of COLUMN SIZE is:
    - The null value if the data type has neither a length nor a precision. i)
    - ii) The maximum length in characters for a character string type.
    - iii) The maximum or fixed precision, as appropriate, for a numeric data type.
    - The maximum or fixed length in positions, as appropriate, for a datetime or interval data type. iv)
    - An implementation defined value for an implementation-defined data type that has a length or v) a precision.
  - The value of LITERAL PREFIX is the character string that shall precede the data type value when a < of this data type is specified. The value of LITERAL\_PREFIX is the null value if no such</p> string is required.
  - The value of LITERAL SUFFIX is the character string that shall follow the data type value when a < of this data type is specified. The value of LITERAL\_SUFFIX is the null value if no such</p> string is required.
  - f) The value of CREATE\_PARAMS is a comma-separated list of specifiable attributes for the data type in the order in which the attributes may be specified. The attributes <length>, and <time fractional seconds precision> appear in the list as LENGTH, PRECISION, SCALE, and PRECISION, respectively. The appearance of attributes in implementation-defined data types is implementation-defined.
  - The value of NULLABLE is 1 (one).
  - The value of CASE\_SENSITIVE is 1 (one) if the data type is a character string type and the default collation for its implementation-defined implicit character set would result in a case sensitive compar-

ison when two values with this data type are compared. Otherwise, the value of CASE\_SENSITIVE is 0 (zero).

- Refer to the <comparison predicate>, <between predicate>, <null predicate>, <quantified comparison predicate>, and <match predicate> as the basic predicates. If the data type can be the data type of an operand in the e predicate >, then let VI be 1 (one); otherwise let VI be 0 (zero). If the data type can be the data type of a column of a <row value constructor predicand> immediately contained in a basic predicate, then let V2 be 2; otherwise let V2 be 0 (zero). The value of SEARCH-ABLE is (V1+V2).
- The value of UNSIGNED ATTRIBUTE is

### Case:

- i)
- ii)
- iii)
- k) The value of FIXED PREC SCALE is

### Case:

- If a sign is not applicable to the data type, then the null value of FIXED\_PREC\_SCALE is i)
- Otherwise, 0 (zero).
- The value of AUTO UNIQUE VALUE is

- If a column of this data type is set to a value unique among all rows of that column when a row i) is inserted, then 1 (one).
- ii) Otherwise, 0 (zero)
- m) The value of LOCAL\_TYPE\_NAME is an implementation-defined localized representation of the name of the data type intended primarily for display purposes. The value of LOCAL\_TYPE\_NAME is the null value if a localized representation is not supported.
- The value of MINIMUM\_SCALE is:
  - The null value if the data type has neither a scale nor a fractional seconds precision. i)
  - The minimum value of the scale for a data type that has a scale.
  - The minimum value of the fractional seconds precision for a data type that has a fractional seconds precision.
- The value of MAXIMUM\_SCALE is:
  - i) The null value if the data type has neither a scale nor a fractional seconds precision.
  - ii) The maximum value of the scale for a data type that has a scale.
  - iii) The maximum value of the fractional seconds precision for a data type that has a fractional seconds precision.

# ISO/IEC 9075-3:2016(E) 6.45 GetTypeInfo

- p) The value of SQL\_DATA\_TYPE is the code value for the predefined data type as defined in Table 7, "Codes used for implementation data types in SQL/CLI".
- q) The value of SQL\_DATETIME\_SUB is

### Case:

- i) If the data type is a datetime type, then the code value for the datetime type as defined in Table 9, "Codes associated with datetime data types in SQL/CLI".
- ii) If the data type is an interval type, then the code value for the interval type as defined in Table 10, "Codes associated with <interval qualifier> in SQL/CLI".
- iii) Otherwise, the null value.
- r) The value of NUM\_PREC\_RADIX is

### Case:

- i) If the value of PRECISION is the value of a precision, then the radix of that precision.
- ii) Otherwise, the null value.
- s) The value of SQL\_INTERVAL\_PRECISION is

### Case:

- i) If the data type is an interval type, then <interval leading field precision>.
- ii) Otherwise, the null value.
- 9) Case:
  - a) If *D* is the code value corresponding to ALL TYPES in Table 27, "Miscellaneous codes used in CLI", then let *P* be the character string

```
SELECT *
FROM TYPE_INFO
ORDER BY DATA_TYPE
```

b) Otherwise, let P be the character string

```
SELECT *
FROM TYPE_INFO
WHERE DATA_TYPE = d
```

10) ExecDirect is implicitly invoked with *S* as the value of StatementHandle, *P* as the value of StatementText, and the length of *P* as the value of TextLength.

### 6.46 MoreResults

### **Function**

Determine whether there are more result sets available on a statement handle and, if there are, initialize processing for those result sets.

# **Definition**

```
MoreResults (
StatementHandle IN INTEGER )
RETURNS SMALLINT
```

- 1) Let S be the allocated SQL-statement identified by StatementHandle
- 2) If there is no executed SQL-statement associated with *S*, then a completion condition is raised: *no data no additional result sets returned*.
- 3) Case:
  - a) If there is no CLI cursor associated with *S* and there exists an implementation-defined capability to support that situation, then implementation-defined rules are evaluated and no further General Rules of this Subclause are evaluated.
  - b) If there is no CLI cursor associated with S, then an exception condition is raised: CLI-specific condition function sequence error.
  - c) Otherwise, let CR be the CLI cursor associated with S.
- 4) If CR is currently open, then:
  - a) The General Rules of Subclause 15.4, "Effect of closing a cursor", in [ISO9075-2] are applied, with *CR* as *CURSOR* and DESTROY as *DISPOSITION*.
  - b) Any fetched row associated with S is removed from association with S.
- 5) Let RSS be the result set sequence that was returned by the executed statement associated with S.
- 6) Case
  - a) If RSS is not empty, then:
    - i) The General Rules of Subclause 5.7, "Implicit CLI procedural result cursor", are applied, with *S* as *ALLOCATED STATEMENT*, and *RSS* as *RESULT SET SEQUENCE*.
    - ii) A completion condition is raised: *successful completion*.
  - b) Otherwise, a completion condition is raised: *no data no additional result sets returned*.

# 6.47 NextResult

### **Function**

Determine whether there are more result sets available on a statement handle and, if there are, initialize processing for the next result set on a separate statement handle.

# **Definition**

```
NextResult (
StatementHandle1 IN INTEGER,
StatementHandle2 IN INTEGER)
RETURNS SMALLINT
```

- 1) Let S1 be the allocated SQL-statement identified by StatementHandle1.
- 2) If there is no executed SQL-statement associated with S1, then a completion condition is raised: no data no additional result sets returned.
- 3) Let S2 be the allocated SQL-statement identified by StatementHandle2.
- 4) If there is a prepared statement associated with S2 then an exception condition is raised: *CLI-specific condition* function sequence error.
- 5) Let RSS be the result set sequence that was returned by the executed statement associated with S1.
- 6) Case:
  - a) If *RSS* is not empty, then:
    - i) The General Rules of Subclause 5.7, "Implicit CLI procedural result cursor", are applied, with S2 as ALLOCATED STATEMENT, and RSS as RESULT SET SEQUENCE.
    - ii) A completion condition is raised: *successful completion*.
  - b) Otherwise, a completion condition is raised: no data no additional result sets returned.

# 6.48 NumResultCols

# **Function**

Get the number of result columns.

- Let S be the allocated SQL-statement identified by StatementHandled

  2) Case:

  a) If there is no prepared or executed statement aser CLI-specific condition function seer:

  b) Otherwise, let D be the TOP\_LEVFI a) If there is no prepared or executed statement associated with S, then an exception condition is raised:
  - ow confick to view standards for the standards f b) Otherwise, let *D* be the implementation row descriptor associated with *S* and let *N* be the value of the TOP\_LEVEL\_COUNT field of *D*.
- 3) ColumnCount is set to *N*.

# 6.49 ParamData

### **Function**

Process a deferred parameter value.

# **Definition**

```
ParamData (
StatementHandle IN INTEGER,
Value OUT ANY)
RETURNS SMALLINT
```

- 1) Let S be the allocated SQL-statement identified by StatementHandle
- 2) Case:
  - a) If there is no deferred parameter number associated with S, then an exception condition is raised: *CLI-specific condition function sequence error*.
  - b) Otherwise, let *DPN* be the deferred parameter number associated with *S*.
- 3) Let *APD* be the current application parameter descriptor for *S* and let *N* be the value of the TOP\_LEVEL\_COUNT field of *APD*.
- 4) For each of the first N item descriptor areas NIDA in APD:
  - a) If the OCTET\_LENGTH\_POINTER field of *NIDA* has the same non-zero value as the INDICATOR\_POINTER field of *IDA*, then *SHARE* is true for *NIDA*; otherwise, *SHARE* is false for *NIDA*. Case:
    - i) If SHARE is true for NIDA and the value of the commonly addressed host variable is the appropriate 'Code' for SQL NULL DATA in Table 27, "Miscellaneous codes used in CLI", then NULL is true for NIDA.
    - ii) If *SHARE* is false for *NIDA*, INDICATOR\_POINTER is not zero, and the value of the host variable addressed by INDICATOR\_POINTER is the appropriate 'Code' for SQL NULL DATA in Table 27, "Miscellaneous codes used in CLI", then *NULL* is true for *NIDA*.
    - iii Otherwise, *NULL* is false for *NIDA*.
  - b) If *NULL* is false for *NIDA*, OCTET\_LENGTH\_POINTER is not 0 (zero), and the value of the host variable addressed by OCTET\_LENGTH\_POINTER is the appropriate 'Code' for SQL NULL DATA in Table 27, "Miscellaneous codes used in CLI", then *DEFERRED* is true for *NIDA*; otherwise, *DEFERRED* is false for *NIDA*.
- 5) For each item descriptor area for which *DEFERRED* is true in the first *N* item descriptor areas of *APD* for which LEVEL is 0 (zero), refer to the corresponding <dynamic parameter specification> value as a *deferred* parameter value.

- 6) Let *IDA* be the *DPN*-th item descriptor area of *APD* and let *PT* and *DP* be the values of the TYPE and DATA\_POINTER fields, respectively, of *IDA*.
- 7) If there is no parameter value associated with *DPN*, then

- a) If there is a DATA\_POINTER value associated with *DPN*, then an exception condition is raised: *CLI-specific condition function sequence error*.
- b) Otherwise:
  - i) Value is set to *DP*.
  - ii) DP becomes the DATA\_POINTER value associated with DPN.
  - iii) An exception condition is raised: *CLI-specific condition dynamic parameter value needed*.
- 8) Let *IPD* be the implementation parameter descriptor associated with *S*.
- 9) Let C be the allocated SQL-connection with which S is associated.
- 10) Let V be the parameter value associated with DPN.
- 11) Case:
  - a) If V is not the null value, then:
    - i) Case:
      - 1) If PT indicates CHARACTER, then:
        - A) Let *LO* be the parameter length associated with *DPN* and let *L* be the number of characters of *V* wholly contained in the first *LO* octets of *V*.
        - B) If L exceeds the implementation-defined maximum length value for the CHARACTER data type, then an exception condition is raised: CLI-specific condition invalid string length or buffer length.
      - 2) If PT indicates CHARACTER LARGE OBJECT, then:
        - A) Let LO be the parameter length associated with DPN and let L be the number of characters of V wholly contained in the first LO octets of V.
        - B) If L exceeds the implementation-defined maximum length value for the CHARACTER LARGE OBJECT data type, then an exception condition is raised: CLI-specific condition invalid string length or buffer length.
      - 3) If *PT* indicates BINARY, then:
        - A) Let LO be the parameter length associated with DPN and let L be the minimum of LO and the length of V in octets.
        - B) If L exceeds the implementation-defined maximum length value for the BINARY data type, then an exception condition is raised: CLI-specific condition invalid string length or buffer length.
      - 4) If PT indicates BINARY VARYING, then:

### ISO/IEC 9075-3:2016(E) 6.49 ParamData

- A) Let LO be the parameter length associated with DPN and let L be the minimum of LO and the length of *V* in octets.
- B) If L exceeds the implementation-defined maximum length value for the BINARY VARYING data type, then an exception condition is raised: CLI-specific condition — invalid string length or buffer length.
- 5) If PT indicates BINARY LARGE OBJECT, then:
  - A) Let LO be the parameter length associated with DPN and let L be the minimum of LO and the length of V in octets.
  - B) If L exceeds the implementation-defined maximum length value for the BINARY LARGE OBJECT data type, then an exception condition is raised: CLI-specific condition — invalid string length or buffer length.
- Otherwise, let *L* be zero.
- Let SV be V with effective data type SDT as represented by the length value L and by the values ii) of the TYPE, PRECISION, and SCALE fields of IDA.
- b) Otherwise, let SV be the null value.
- 12) Let TDT be the effective data type of the DPN-th < dynamic parameter specification > as represented by the values of the TYPE, LENGTH, PRECISION, SCALE, DATETIME\_INTERVAL\_CODE, DATE-TIME INTERVAL PRECISION, CHARACTER SET CATALOG, CHARACTER SET SCHEMA, CHARACTER\_SET\_NAME, USER\_DEFINED\_TYPE\_CATALOG, USER\_DEFINED\_TYPE\_SCHEMA, USER\_DEFINED\_TYPE\_NAME, SCOPE\_CATALOG, SCOPE\_SCHEMA, and SCOPE\_NAME fields of the DPN-th item descriptor area of IPD.
- 13) Let SDT be the effective data type of the DPN-th parameter as represented by the values of the TYPE, LENGTH, PRECISION, SCALE, DATETIME\_INTERVAL\_CODE, DATETIME\_INTERVAL\_PRECI-SION, CHARACTER\_SET\_CATALOG, CHARACTER\_SET\_SCHEMA, CHARACTER\_SET\_NAME, USER DEFINED TYPE CATALOG, USER DEFINED TYPE SCHEMA. USER\_DEFINED\_TYPE\_NAME, SCOPE\_CATALOG, SCOPE\_SCHEMA, and SCOPE\_NAME fields in the corresponding item descriptor area of APD.
- 14) Case:
  - If SDT is a locator type, then let TV be the value SV.
  - If SDT and TDT are predefined types, then
    - Case:
      - If the <cast specification>

does not conform to the Syntax Rules of Subclause 6.13, "<cast specification>", in [ISO9075-2], and there is an implementation-defined conversion from type SDT to type TDT, then that implementation-defined conversion is effectively performed, converting SV to type TDT, and the result is the value TV of the i-th bound target.

- 2) Otherwise:
  - A) If the <cast specification>

```
CAST ( SV AS TDT )
```

does not conform to the Syntax Rules of Subclause 6.13, "<cast specification>", in [ISO9075-2], then an exception condition is raised: *dynamic SQL error* — *restricted data type attribute violation*.

B) Let TV be the value obtained, with data type TDT, by effectively performing the <cast specification>

```
CAST ( SV AS TDT )
```

NOTE 54 — It is implementation-dependent whether the establishment of Tyoccurs at this time or during the preceding invocation of PutData.

- ii) Let *UDT* be the effective data type of the actual *DPN*-th <dynamic parameter specification>, defined to be the data type represented by the values of the TYPE, LENGTH, PRECISION, SCALE, DATETIME\_INTERVAL\_CODE, DATETIME\_INTERVAL\_PRECISION, CHARACTER\_SET\_CATALOG, CHARACTER\_SET\_SCHEMA, CHARACTER\_SET\_NAME, SCOPE\_CATALOG, SCOPE\_SCHEMA, and SCOPE\_NAME fields that would automatically be set in the *DPN*-th item descriptor area of *IPD* if POPULATE IPD was *True* for *C*.
- iii) Case:
  - 1) If the <cast specification>

```
CAST ( TV AS UDT )
```

does not conform to the Syntax Rules of Subclause 6.13, "<cast specification>", in [ISO9075-2], and there is an implementation-defined conversion from type *SDT* to type *UDT*, then that implementation-defined conversion is effectively performed, converting *SV* to type *UDT*, and the result is the value *TV* of the *i*-th bound target.

- 2) Otherwise:
  - A) If the <cast specification>

```
CAST ( TV AS UDT
```

does not conform to the Syntax Rules of Subclause 6.13, "<cast specification>", in [ISO9075-2], then an exception condition is raised: *dynamic SQL error* — *restricted data type attribute violation*.

B) If the <cast specification>

```
CAST ( TV AS UDT )
```

does not conform to the General Rules of Subclause 6.13, "<cast specification>", in [ISO9075-2], then an exception condition is raised in accordance with the General Rules of Subclause 6.13, "<cast specification>", in [ISO9075-2].

C) The <cast specification>

```
CAST ( TV AS UDT )
```

is effectively performed and is the value of the *DPN*-th dynamic parameter.

# ISO/IEC 9075-3:2016(E) 6.49 ParamData

- 15) Let *PN* be the parameter number associated with a deferred parameter value and let *HPN* be the value of MAX(*PN*).
- 16) If *DPN* is not equal to *HPN*, then:
  - a) Let *NPN* be the lowest value of *PN* for which  $DPN < NPN \le HPN$ .
  - b) Let *DP* be the value of the DATA\_POINTER field of the *NPN*-th item descriptor area of *APD* for which LEVEL is 0 (zero).
  - c) *NPN* becomes the deferred parameter number associated with *S* and *DP* becomes the DATA POINTER value associated with the deferred parameter number.
  - d) An exception condition is raised: CLI-specific condition dynamic parameter value needed.
- 17) If *DPN* is equal to *HPN*, then:
  - a) *DPN* is removed from association with *S*.
  - b) Case:
    - i) If there is a select source associated with S, then let SS be the select source associated with S.
    - ii) Otherwise:
      - 1) Let SS be the statement source associated with S.
      - 2) SS is removed from association with SQ
  - c) The General Rules of Subclause 5.5, "Executing a statement", are applied, with *S* as *ALLOCATED STATEMENT*, *P* as *PREPARED STATEMENT*, and "ParamData" as *INVOKER*.

# 6.50 Prepare

# **Function**

Prepare a statement.

### **Definition**

```
Prepare (
   StatementHandle
                         IN
                                   INTEGER,
                                   CHARACTER(L),
    StatementText
                         IN
    TextLength
                         IN
                                   INTEGER )
    RETURNS SMALLINT
```

where L has a maximum value equal to the implementation-defined maximum length of a variable-length character string.

- 1) Let S be the allocated SQL-statement identified by StatementHandle.
- 2) Let *TL* be the value of TextLength.
- 3) Let ST be the value of StatementText.
- 4) The General Rules of Subclause 5.4, "Preparing a statement", are applied, with S as ALLOCATED STATEMENT, ST as STATEMENT TEXT, To as TEXT LENGTH, and "Prepare" as INVOKER, resulting in P.
- 5) *P* is prepared and the prepared statement is associated with *S*.

# 6.51 PrimaryKeys

### **Function**

Return a result set that contains a list of the column names that comprise the primary key for a single specified of 15011EC 9015:3:2016 table stored in the information schemas of the connected data source.

# **Definition**

```
PrimaryKeys (
                         IN INTEGER,
   StatementHandle
   CatalogName
                          IN CHARACTER(L1),
   NameLength1
                          IN SMALLINT,
   SchemaName
                          IN CHARACTER(L2),
   NameLength2
                          IN SMALLINT,
   TableName
                           IN CHARACTER(L3),
   NameLength3
                           IN SMALLINT )
   RETURNS SMALLINT
```

where each of L1, L2, and L3 has a maximum value equal to the implementation-defined maximum length of a variable-length character string.

- 1) Let S be the allocated SQL-statement identified by StatementHandle.
- 2) If an open CLI cursor is associated with S, then an exception condition is raised: *invalid cursor state*.
- 3) Let C be the allocated SQL-connection with which S is associated.
- 4) Let EC be the established SQL-connection associated with C and let SS be the SQL-server on that connection.
- 5) Let *PRIMARY\_KEYS\_QUERY* be a table, with the definition:

```
CREATE TABLE PRIMARY KEYS QUERY (
        TABLE_CAT CHARACTER VARYING(128),
TABLE_SCHEM CHARACTER VARYING(128) NOT NULL,
TABLE_NAME CHARACTER VARYING(128) NOT NULL,
COLUMN NAME CHARACTER VARYING(128) NOT NULL,
ORDINAL_POSITION SMALLINT NOT NULL,
PK NAME
        PK_NAME
                                                             CHARACTER VARYING(128) )
```

- 6) Let PKS represent the set of rows in SS's Information Schema TABLE CONSTRAINTS view where the value of CONSTRAINT TYPE is 'PRIMARY KEY'.
- 7) Let PK COLS represent the set of rows that define the columns within an individual primary key row in PKS. These rows are formed by a natural inner join on the values in the CONSTRAINT CATALOG, CONSTRAINT\_SCHEMA, and CONSTRAINT\_NAME columns between a row in PKS and the matching row or rows in SS's Information Schema KEY COLUMN USAGE view.
- 8) Let PKS COLS represent the set of rows in the combination of all PK COLS sets.

- 9) PRIMARY\_KEYS\_QUERY contains a row for each row in PKS\_COLS where:
  - a) Let *SUP* be the value of Supported that is returned by the execution of GetFeatureInfo with FeatureType = 'FEATURE' and FeatureId = 'C041' (corresponding to the feature "Information Schema metadata constrained by privileges").
  - b) Case:
    - i) If the value of *SUP* is 1 (one), then *PRIMARY\_KEYS\_QUERY* contains a row for each column of the primary key for a specific table in *SS*'s Information Schema TABLE\_CONSTRAINTS view.
    - ii) Otherwise, *PRIMARY\_KEYS\_QUERY* contains a row for each column of the primary key for a specific table in *SS*'s Information Schema TABLE\_CONSTRAINTS view in accordance with implementation-defined authorization criteria.
- 10) For each row of PRIMARY KEYS QUERY:
  - a) If the implementation does not support catalog names, then TABLE\_CAT is set to the null value; otherwise, the value of TABLE\_CAT in *PRIMARY\_KEYS\_QUERY* is the value of the TABLE\_CATALOG column in *PKS*.
  - b) The value of TABLE\_SCHEM in *PRIMARY\_KEYS\_QUERY* is the value of the TABLE\_SCHEMA column in *PKS*.
  - c) The value of TABLE\_NAME in *PRIMARY\_KEYS\_QUERY* is the value of the TABLE\_NAME column in *PKS*.
  - d) The value of COLUMN\_NAME in *PRIMARY\_KEYS\_QUERY* is the value of the COLUMN\_NAME column in *PKS\_COLS*.
  - e) The value of ORDINAL\_POSITION in *PRIMARY\_KEYS\_QUERY* is the value of the ORDINAL\_POSITION column in *PKS\_COLS*.
  - f) The value of PK\_NAME in *PRIMARY\_KEYS\_QUERY* is the value of the CONSTRAINT\_NAME column in *PKS*.
- 11) Let NL1, NL2, and NL3 be the values of NameLength1, NameLength2, and NameLength3, respectively.
- 12) Let *CATVAL*, *SCHVAL* and *TBLVAL* be the values of CatalogName, SchemaName, and TableName, respectively.
- 13) If the METADATA ID attribute of *S* is TRUE, then:
  - a) If CatalogName is a null pointer and the value of the CATALOG NAME information type from Table 29, "Codes and data types for implementation information", *Y*, then an exception condition is raised: *CLI-specific condition invalid use of null pointer*.
  - b) If SchemaName is a null pointer, then an exception condition is raised: *CLI-specific condition* invalid use of null pointer.
- 14) If TableName is a null pointer, then an exception condition is raised: *CLI-specific condition invalid use of null pointer*.
- 15) If CatalogName is a null pointer, then *NL1* is set to zero. If SchemaName is a null pointer, then *NL2* is set to zero. If TableName is a null pointer, then *NL3* is set to zero.
- 16) Case:

# ISO/IEC 9075-3:2016(E) 6.51 PrimaryKeys

- a) If *NL1* is not negative, then let *L* be *NL1*.
- b) If *NL1* indicates NULL TERMINATED, then let *L* be the number of octets of CatalogName that precede the implementation-defined null character that terminates a C character string.
- c) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.

Let *CATVAL* be the first *L* octets of CatalogName.

### 17) Case:

- a) If NL2 is not negative, then let L be NL2.
- b) If *NL2* indicates NULL TERMINATED, then let *L* be the number of octets of SchemaName that precede the implementation-defined null character that terminates a C character string.
- c) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.

Let SCHVAL be the first L octets of SchemaName.

### 18) Case:

- a) If NL3 is not negative, then let L be NL3.
- b) If *NL3* indicates NULL TERMINATED, then let *L* be the number of octets of TableName that precede the implementation-defined null character that terminates a C character string.
- c) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.

Let *TBLVAL* be the first *L* octets of TableName.

### 19) Case:

- a) If the METADATA ID attribute of S is TRUE, then:
  - i) Case:
    - 1) If the value of *NL1* is zero, then let *CATSTR* be a zero-length string.
    - Otherwise,

Case:

A) If SUBSTRING(TRIM('CATVAL') FROM 1 FOR 1) = '"' and if SUBSTRING(TRIM('CATVAL') FROM CHAR\_LENGTH(TRIM('CATVAL')) FOR 1) = '"', then let TEMPSTR be the value obtained from evaluating:

```
SUBSTRING(TRIM('CATVAL') FROM 2
FOR CHAR_LENGTH(TRIM('CATVAL')) - 2)
```

and let *CATSTR* be the character string:

```
TABLE_CAT = 'TEMPSTR' AND
```

B) Otherwise, let *CATSTR* be the character string:

```
UPPER(TABLE_CAT) = UPPER('CATVAL') AND
```

- ii) Case:
  - 1) If the value of *NL2* is zero, then let *SCHSTR* be a zero-length string.
  - 2) Otherwise,

Case:

A) If SUBSTRING(TRIM('SCHVAL') FROM 1 FOR 1) = '"' and if SUBSTRING(TRIM('SCHVAL') FROM CHAR\_LENGTH(TRIM('SCHVAL')) FOR 1) = '"', then let TEMPSTR be the value obtained from evaluating:

```
SUBSTRING(TRIM('SCHVAL') FROM 2
FOR CHAR_LENGTH(TRIM('SCHVAL')) - 2)
```

and let SCHSTR be the character string:

```
TABLE_SCHEM = 'TEMPSTR' AND
```

B) Otherwise, let *SCHSTR* be the character string:

```
UPPER(TABLE_SCHEM) = UPPER('SCHWAL') AND
```

- iii) Case:
  - 1) If the value of *NL3* is zero, then let *TBLSTR* be a zero-length string.
  - 2) Otherwise,

Case:

A) If SUBSTRING(TRIM('TBLVAL') FROM 1 FOR 1) = '"' and if SUBSTRING(TRIM('TBLVAL') FROM CHAR\_LENGTH(TRIM('TBLVAL')) FOR 1) = '"' then let TEMPSTR be the value obtained from evaluating:

```
SUBSTRING(TRIM('TBLVAL') FROM 2
FOR CHAR_LENGTH(TRIM('TBLVAL')) - 2)
```

and let *TBLSTR* be the character string:

```
TABLE_NAME = 'TEMPSTR' AND
```

B) Otherwise, let *TBLSTR* be the character string:

```
UPPER(TABLE_NAME) = UPPER('TBLVAL') AND
```

- b) Otherwise,
  - i) If the value of *NL1* is zero, then let *CATSTR* be a zero-length string; otherwise, let *CATSTR* be the character string:

```
TABLE_CAT = 'CATVAL' AND
```

### ISO/IEC 9075-3:2016(E) 6.51 PrimaryKeys

If the value of NL2 is zero, then let SCHSTR be a zero-length string; otherwise, let SCHSTR be ii) the character string:

```
TABLE_SCHEM = 'SCHVAL' AND
```

If the value of NL3 is zero, then let TBLSTR be a zero-length string; otherwise, let TBLSTR be iii) the character string:

```
TABLE_NAME = 'TBLVAL' AND
```

20) Let *PRED* be the result of evaluating:

```
CATSTR | | ' ' | | SCHSTR | | ' ' | | TBLSTR | | ' ' | | 1=1
```

21) Let *STMT* be the character string:

```
SELECT *
FROM PRIMARY_KEYS_QUERY
WHERE PRED
ORDER BY TABLE_CAT, TABLE_SCHEM, TABLE_NAME, ORDINAL_POSITION
```

ExecDirect is implicitly invoked with *S* as the value of Stateme Text, and the length of *STMT* as the value of TextLength.

Citch view the statement of the s 22) ExecDirect is implicitly invoked with S as the value of StatementHandle, STMT as the value of Statement-

# 6.52 PutData

### **Function**

Provide a deferred parameter value.

### **Definition**

```
PutData (
StatementHandle IN INTEGER,
Data IN ANY,
StrLen_or_Ind IN INTEGER)
RETURNS SMALLINT
```

- 1) Let S be the allocated SQL-statement identified by StatementHandle
- 2) Case:
  - a) If there is no deferred parameter number associated with *S*, then an exception condition is raised: *CLI-specific condition function sequence error*.
  - b) Otherwise, let *DPN* be the deferred parameter number associated with *S*.
- 3) If there is no DATA\_POINTER value associated with DPN, then an exception condition is raised: *CLI*-specific condition function sequence error.
- 4) Let APD be the current application parameter descriptor for S.
- 5) Let *PT* be the value of the TYPE field of the *DPN*-th item descriptor area of *APD* for which LEVEL is 0 (zero).
- 6) Let *IV* be the value of StrLen\_or\_Ind.
- 7) If there is a parameter value associated with *DPN* and *PT* does not indicate CHARACTER, CHARACTER LARGE OBJECT, BINARY, BINARY VARYING, or BINARY LARGE OBJECT, then an exception is raised: *CLI-specific condition non-string data cannot be sent in pieces*.
- 8) Case:
  - a) If *W* is the appropriate 'Code' for SQL NULL DATA in Table 27, "Miscellaneous codes used in CLI", then let *V* be the null value.
  - b) If PT indicates CHARACTER or CHARACTER LARGE OBJECT, then:
    - i) Case:
      - 1) If IV is not negative, then let L be IV.
      - 2) If *IV* indicates NULL TERMINATED, then let *L* be the number of octets in the characters of Data that precede the implementation-defined null character that terminates a C character string.

# ISO/IEC 9075-3:2016(E) 6.52 PutData

- 3) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.
- ii) Let V be the first L octets of Data.
- c) If PT indicates BINARY, BINARY VARYING, or BINARY LARGE OBJECT, then:
  - i) Case:
    - 1) If *IV* is not negative, then let *L* be *IV*.
    - 2) Otherwise, an exception condition is raised: *CLI-specific condition invalid attribute* value.
  - ii) Let V be the first L octets of Data.
- d) Otherwise, let V be the value of Data.
- 9) If *V* is not a valid value of the data type indicated by *PT*, then an exception condition is raised: *dynamic SQL error using clause does not match dynamic parameter specifications*.
- 10) If there is no parameter value associated with *DPN*, then:
  - a) V becomes the parameter value associated with DPN.
  - b) If *V* is not the null value and *PT* indicates CHARACTER, CHARACTER LARGE OBJECT, BINARY, BINARY VARYING, or BINARY LARGE OBJECT, then *L* becomes the parameter length associated with *DPN*.
- 11) If there is a parameter value associated with *DPN*, then

- a) If V is the null value, then:
  - i) *DPN* is removed from association with *S*.
  - ii) Any statement source associated with S is removed from association with S.
  - iii) An exception condition is raised: CLI-specific condition attempt to concatenate a null value.
- b) Otherwise:
  - i) Let *PV* be the parameter value associated with *DPN*.
  - 11) Case:
    - 1) If PV is the null value, then:
      - A) *DPN* is removed from association with *S*.
      - B) Any statement source associated with S is removed from association with S.
      - C) An exception condition is raised: *CLI-specific condition attempt to concatenate a null value*.
    - 2) Otherwise:
      - A) Let PL be the parameter length associated with DPN.

B) Let NV be the result of the <string value function>

PV | | V

C) NV becomes the parameter value associated with DPN and (PL+L) becomes the parameter length associated with DPN.

# 6.53 RowCount

# **Function**

Get the row count.

- Let S be the allocated SQL-statement identified by StatementHandle

  1) Let S be the allocated statement associated with S, then an exception condition—function sequence error.

  3) RowCount is set to the value of the row con.

### 6.54 SetConnectAttr

### **Function**

Set the value of an SQL-connection attribute.

### **Definition**

```
SetConnectAttr(
ConnectionHandle IN INTEGER,
Attribute IN INTEGER,
Value IN ANY,
StringLength IN INTEGER)
RETURNS SMALLINT
```

# **General Rules**

- 1) Case:
  - a) If ConnectionHandle does not identify an allocated SQL-connection, then an exception condition is raised: *CLI-specific condition invalid handle*.
  - b) Otherwise:
    - i) Let C be the allocated SQL-connection identified by ConnectionHandle.
    - ii) The diagnostics area associated with C is emptied.
- 2) Let *A* be the value of Attribute.
- 3) If A is not one of the code values in Table 17, "Codes used for connection attributes", or if A is one of the code values in Table 17, "Codes used for connection attributes", but the row that contains A contains 'No' in the 'May be set' column, then an exception condition is raised: CLI-specific condition invalid attribute identifier.
- 4) If A indicates SAVEPOINT NAME, then:
  - a) Let *SL* be the value of StringLength.
  - b) Case:
    - i) If SL is not negative, then let L be SL.
    - If *SL* indicates NULL TERMINATED, then let *L* be the number of octets of Value that precede the implementation-defined null character that terminates a C character string.
    - iii) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.
  - c) The SAVEPOINT NAME attribute of C is set to the first L octets of Value.
- 5) If A specifies an implementation-defined connection attribute, then

# ISO/IEC 9075-3:2016(E) 6.54 SetConnectAttr

- a) If the data type for the connection attribute is specified as INTEGER in Table 20, "Data types of attributes", then the connection attribute is set to the value of Value.
- b) Otherwise:
  - i) Let *SL* be the value of StringLength.
  - ii) Case:
    - 1) If SL is not negative, then let L be SL.
    - 2) If *SL* indicates NULL TERMINATED, then let *L* be the number of octets of Value that precede the implementation-defined null character that terminates a C character string.
    - 3) Otherwise, an exception condition is raised: *CLI-specific condition* walld string length or buffer length.
  - iii) The connection attribute is set to the first L octets of Value

### 6.55 SetCursorName

# **Function**

Set the cursor name property associated with an allocated SQL-statement.

### **Definition**

```
SetCursorName (
StatementHandle IN INTEGER,
CursorName IN CHARACTER(L),
NameLength IN SMALLINT)
RETURNS SMALLINT
```

where L has a maximum value equal to the implementation-defined maximum length of a variable-length character string.

- 1) Let S be the allocated SQL-statement identified by StatementHandle.
- 2) If an open CLI cursor is associated with S, then an exception condition is raised: *invalid cursor state*.
- 3) Let *NL* be the value of NameLength.
- 4) Case:
  - a) If NL is not negative, then let L be NL.
  - b) If *NL* indicates NULL TERMINATED, then let *L* be the number of octets of CursorName that precede the implementation-defined null character that terminates a C character string.
  - c) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.
- 5) Case:
  - a) If L is zero, then an exception condition is raised: CLI-specific condition invalid string length or buffer length.
  - b) Otherwise, let N be the number of whole characters in the first L octets of CursorName and let NO be the number of octets occupied by those N characters. If  $NO \neq L$ , then an exception condition is raised: invalid cursor name; otherwise, let CV be the first L octets of CursorName and let TCN be the value of

```
TRIM ( BOTH ' ' FROM 'CV' )
```

- 6) Let *ML* be the maximum length in characters allowed for an <identifier> as specified in the Syntax Rules of Subclause 5.4, "Names and identifiers", in [ISO9075-2], and let *TCNL* be the length in characters of *TCN*.
- 7) Case:

### ISO/IEC 9075-3:2016(E) 6.55 SetCursorName

- a) If TCNL is greater than ML, then CN is set to the first ML characters of TCN and a completion condition is raised: warning — string data, right truncation.
- Otherwise, CN is set to TCN.
- 8) If CN does not conform to the Format and Syntax Rules of an <identifier>, then an exception condition is raised: invalid cursor name.
- 9) Let C be the allocated SQL-connection with which S is associated and let SC be the <search condition>:

CN LIKE 'SQL\\_CUR%' ESCAPE '\' OR CN LIKE 'SQLCUR%'

an allocate i.e. and alloc If SC is  $\underline{True}$  or if CN is identical to the value of any cursor name associated with an allocated SQL-statement

10) CN becomes the value of the cursor name property associated with S.

### 6.56 SetDescField

### **Function**

Set a field in a CLI descriptor area.

### **Definition**

```
SetDescField (
   DescriptorHandle
                         TN
                                   INTEGER,
   RecordNumber
                         IN
                                   SMALLINT,
   FieldIdentifier
                         IN
                                   SMALLINT,
   Value
                         TN
                                   ANY.
   BufferLength
                                   INTEGER )
                         IN
   RETURNS SMALLINT
```

- 1) Let *D* be the allocated CLI descriptor area identified by DescriptorHandle and let *N* be the value of the COUNT field of *D*.
- 2) The General Rules of Subclause 5.16, "Deferred parameter check", are applied to *D* as the DESCRIPTOR AREA.
- 3) Let FI be the value of FieldIdentifier.
- 4) If FI is not one of the code values in Table 21, "Codes used for SQL/CLI descriptor fields", then an exception condition is raised: CLI-specific condition invalid descriptor field identifier.
- 5) Case:
  - a) If the ALLOC\_TYPE field of descriptor *D* is USER and *D* is not being used as the current ARD or current APD of any statement handle, then let *DT* be ARD.
  - b) Otherwise, let DT be the type of the descriptor D.
- 6) Let MBS be the value of the May Be Set column in the row of Table 22, "Ability to set SQL/CLI descriptor fields", that contains FI and in the column that contains the descriptor type DT.
- 7) If MBS is No', then an exception condition is raised: CLI-specific condition invalid descriptor field identifier.
- 8) Let RN be the value of RecordNumber.
- 9) Let *TYPE* be the value of the Type column in the row of Table 21, "Codes used for SQL/CLI descriptor fields", that contains *FI*.
- 10) If TYPE is 'ITEM' and RN is less than 1 (one), then an exception condition is raised: dynamic SQL error—invalid descriptor index.
- 11) Let *IDA* be the item descriptor area of *D* specified by *RN*.

# ISO/IEC 9075-3:2016(E) 6.56 SetDescField

- 12) If an exception condition is raised in any of the following General Rules, then all fields of *IDA* for which specific values were provided in the invocation of SetDescField are set to implementation-dependent values and the value of COUNT for *D* is unchanged.
- 13) Information is set in *D*:

### Case:

a) If FI indicates COUNT, then

- i) If the memory requirements to manage the CLI descriptor area cannot be satisfied, then an exception condition is raised: *CLI-specific condition memory allocation error*.
- ii) Otherwise, the count of the number of item descriptor areas is set to the value of Value.
- b) If FI indicates ARRAY\_SIZE, then the value of the ARRAY\_SIZE header field of descriptor D is set to Value.
- c) If FI indicates ARRAY\_STATUS\_POINTER, then the value of the ARRAY\_STATUS\_POINTER header field of descriptor D is set to the address of Value. If Value is a null pointer, then the address is set to 0 (zero).
- d) If FI indicates ROWS\_PROCESSED\_POINTER, then the value of the ROWS\_PROCESSED\_POINTER header field of descriptor D is set to the address of Value. If Value is a null pointer, then the address is set to 0 (zero).
- e) If *FI* indicates OCTET\_LENGTH\_POINTER, then the value of the OCTET\_LENGTH\_POINTER field of *IDA* is set to the address of Value.
- f) If FI indicates DATA\_POINTER, then the value of the DATA\_POINTER field of IDA is set to the address of Value. If Value is a null pointer, then the address is set to 0 (zero).
- g) If FI indicates INDICATOR\_POINTER, then the value of the INDICATOR\_POINTER field of IDA is set to the address of Value.
- h) If FI indicates RETURNED\_CARDINALITY\_POINTER, then the value fo the RETURNED\_CARDINALITY\_POINTER field of IDA is set to the address of Value.
- i) If *FI* indicates CHARACTER\_SET\_CATALOG, CHARACTER\_SET\_SCHEMA, or CHARACTER\_SET\_NAME, then:
  - i) Let *BL* be the value of BufferLength.
  - ii) Case:
    - 1) If BL is not negative, then let L be BL.
    - 2) If *BL* indicates NULL TERMINATED, then let *L* be the number of octets of Value that precedes the implementation-defined null character that terminates a C character string.
    - 3) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.
  - iii) Case:

- 1) If L is zero, then an exception condition is raised: CLI-specific condition invalid string length or buffer length.
- 2) Otherwise, let FV be the first l octets of Value and let TFV be the value of

```
TRIM ( BOTH ' ' FROM 'FV' )
```

- iv) Let *ML* be the maximum length in characters allowed for an <identifier> as specified in the Syntax Rules of Subclause 5.4, "Names and identifiers", in [ISO9075-2], and let *TFVL* be the length in characters of *TFV*.
- v) Case:
  - 1) If TFVL is greater than ML, then FV is set to the first ML characters of TFV and a completion condition is raised: warning string data, right truncation.
  - 2) Otherwise, FV is set to TFV.
- vi) Case:
  - 1) If FI indicates CHARACTER\_SET\_CATALOG and FV does not conform to the Format and Syntax Rules of an <identifier>, then an exception condition is raised: invalid catalog name.
  - 2) If *FI* indicates CHARACTER\_SET\_SCHEMA and *FV* does not conform to the Format and Syntax Rules of an <identifier>, then an exception condition is raised: *invalid schema name*.
  - 3) If FI indicates CHARACTER\_SET\_NAME and FV does not conform to the Format and Syntax Rules of an <identifiers, then an exception condition is raised: invalid character set name.
- vii) The value of the field of *IDA* identified by *FI* is set to the value of *FV*.
- j) Otherwise, the value of the field of *IDA* identified by *FI* is set to the value of Value.
- 14) If FI indicates LEVEL, then:
  - a) If RI is 1 (one) and value is not 0 (zero), then an exception condition is raised: dynamic SQL error—invalid LEVEL value.
  - b) If *RI* is greater than 1 (one), then let *PIDA* be *IDA*'s immediately preceding item descriptor area and let *K* be its LEVEL value.
    - i) If Value is *K*+1 and TYPE in *PIDA* does not indicate ROW, ARRAY, ARRAY LOCATOR, MULTISET, or MULTISET LOCATOR, then an exception condition is raised: *dynamic SQL error invalid LEVEL value*.
    - ii) If Value is greater than K+1, then an exception condition is raised: dynamic SQL error invalid LEVEL value.
    - ii) If value is less than K+1, then let  $OIDA_i$  be the i-th item descriptor area to which PIDA is subordinate and whose TYPE field indicates ROW. Let  $NS_i$  be the number of immediately subordinate descriptor areas of  $OIDA_i$  between  $OIDA_i$  and IDA, and let  $D_i$  be the value of DEGREE of  $OIDA_i$ .

# ISO/IEC 9075-3:2016(E) 6.56 SetDescField

- 1) For each  $OIDA_i$  whose LEVEL value is greater than V, if  $D_i$  is not equal to  $NS_i$ , then an exception condition is raised:  $dynamic SQL \ error invalid \ LEVEL \ value$ .
- 2) If K is not 0 (zero), then let  $OIDA_i$  be the  $OIDA_j$  whose LEVEL value is K. If there exists no such  $OIDA_j$  or  $D_j$  is not greater than  $NS_j$ , then an exception condition is raised: dynamic  $SOL\ error\ invalid\ LEVEL\ value$ .
- c) The value of LEVEL in *IDA* is set to Value.
- 15) If TYPE is 'ITEM' and RN is greater than N, then the COUNT field of D is set to RN.
- 16) If FI indicates TYPE, LENGTH, OCTET\_LENGTH, PRECISION, SCALE, DATETIME\_INTER-VAL\_CODE, DATETIME\_INTERVAL\_PRECISON, PARAMETER\_MODE, PARAMETER\_ORDINAL\_POSITION, PARAMETER\_SPECIFIC\_CATALOG, PARAMETER\_SPECIFIC\_SCHEMA, PARAMETER\_SPECIFIC\_NAME, CHARACTER\_SET\_CATALOG, CHARACTER\_SET\_SCHEMA, CHARACTER\_SET\_NAME, USER\_DEFINED\_TYPE\_CATALOG, USER\_DEFINED\_TYPE\_SCHEMA, USER\_DEFINED\_TYPE\_NAME, SCOPE\_CATALOG, SCOPE\_SCHEMA, or SCOPE\_NAME, then the DATA\_POINTER field of IDA is set to zero.
- 17) If FI indicates DATA\_POINTER, and Value is not a null pointer, and DA is not consistent as specified in Subclause 5.18, "Description of CLI item descriptor areas", then an exception condition is raised: CLI-specific condition inconsistent descriptor information.
- 18) Let *V* be the value of Value.
- 19) If FI indicates TYPE, then:
  - a) All the other fields of *IDA* are set to implementation-dependent values.
  - b) Case:
    - i) If *V* indicates CHARACTER CHARACTER VARYING or CHARACTER LARGE OBJECT then the CHARACTER\_SET\_CATALOG, CHARACTER\_SET\_SCHEMA, and CHARACTER\_SET\_NAME fields of *IDA* are set to the values for the default character set name for the SQL-session and the LENGTH field of *IDA* is set to the maximum possible length in characters of the indicated data type.
    - ii) If *V* indicates BINARY, BINARY VARYING, or BINARY LARGE OBJECT, then the LENGTH field of *IDA* is set to the maximum possible length in octets of the indicated data type.
    - iii) If Vindicates a <datetime type>, then the PRECISION field of IDA is set to 0 (zero).
    - iv) If V indicates INTERVAL, then the DATETIME\_INTERVAL\_PRECISION field of IDA is set to 2.
    - If *V* indicates NUMERIC or DECIMAL, then the SCALE field of *IDA* is set to 0 (zero) and the PRECISION field of *IDA* is set to the implementation-defined default value for the precision of the NUMERIC or DECIMAL data types, respectively.
    - vi) If *V* indicates SMALLINT, INTEGER, or BIGINT, then the SCALE field of *IDA* is set to 0 (zero) and the PRECISION field of *IDA* is set to the implementation-defined value for the precision of the SMALLINT, INTEGER, or BIGINT data types, respectively.
    - vii) If *V* indicates FLOAT, then the PRECISION field of *IDA* is set to the implementation-defined default value for the precision of the FLOAT data type.

- viii) If *V* indicates REAL or DOUBLE PRECISION, then the PRECISION field of *IDA* is set to the implementation-defined value for the precision of the REAL or DOUBLE PRECISION data types, respectively.
- ix) If *V* indicates DECFLOAT, then the PRECISION field of *IDA* is set to the implementation-defined default value for the precision of the DECFLOAT data type.
- x) If *V* indicates an implementation-defined data type, then an implementation-defined set of fields of *IDA* are set to implementation-defined default values.
- xi) Otherwise, an exception condition is raised: *CLI-specific condition* invalid data type.
- 20) If *FI* indicates DATETIME\_INTERVAL\_CODE and the TYPE field of *IDA* indicates a datetime type>, then:
  - a) All the fields of *IDA* other than DATETIME\_INTERVAL\_CODE and TYPE are set to implementation-dependent values.
  - b) Case:
    - i) If *V* indicates DATE, TIME, or TIME WITH TIME ZONE then the PRECISION field of *IDA* is set to 0 (zero).
    - ii) If *V* indicates TIMESTAMP or TIMESTAMP WITH TIME ZONE, then the PRECISION field of *IDA* is set to 6.
- 21) If *FI* indicates DATETIME\_INTERVAL\_CODE and the TYPE field of *IDA* indicates INTERVAL, then the DATETIME\_INTERVAL\_PRECISION field of IDA is set to 2 and
  - a) If *V* indicates DAY TO SECOND, HOUR TO SECOND, MINUTE TO SECOND, or SECOND, then the PRECISION field of *IDA* is set to 6.
  - b) Otherwise, the PRECISION field of DA is set to 0 (zero).
- 22) Restrictions on the differences allowed between implementation and application parameter descriptors are implementation-defined, except as specified in the General Rules of Subclause 5.10, "Implicit EXECUTE USING and OPEN USING clauses", in the General Rules of Subclause 5.11, "Implicit CALL USING clause", and in the General Rules of Subclause 6.49, "ParamData". Restrictions on the differences between the implementation and application row descriptors are implementation-defined, except as specified in the General Rules of Subclause 5.13, "Implicit FETCH USING clause", and the General Rules of Subclause 6.30, "GetData".

### 6.57 SetDescRec

### **Function**

Set commonly-used fields in a CLI descriptor area.

### **Definition**

SetDescRec (		
DescriptorHandle	IN	INTEGER,
RecordNumber	IN	SMALLINT,
Type	IN	SMALLINT,
SubType	IN	SMALLINT,
Length	IN	INTEGER,
Precision	IN	SMALLINT,
Scale	IN	SMALLINT,
Data	DEF	ANY,
StringLength	DEF	INTEGER,
Indicator	DEF	INTEGER )
RETURNS SMALLINT		

### **General Rules**

- the full PDF of ISOILEC 9075-3:2016 Let D be the allocated CLI descriptor area identified by DescriptorHandle and let N be the value of the COUNT field of D.
- The General Rules of Subclause 5.16, "Deferred parameter check", are applied to D as the DESCRIPTOR AREA.
- 3) If D is an implementation row descriptor, then an exception condition is raised: CLI-specific condition cannot modify an implementation row descriptor.
- 4) Let *RN* be the value of RecordNumber.
- 5) If RN is less than 1 (one), then an exception condition is raised: dynamic SQL error invalid descriptor index.
- 6) If RN is greater than N, then

Case:

- a) If the memory requirements to manage the larger CLI descriptor area cannot be satisfied, then an Sexception condition is raised: *CLI-specific condition* — *memory allocation error*.
- b) Otherwise, the COUNT field of *D* is set to *RN*.
- 7) Let *IDA* be the item descriptor area of *D* specified by *RN*.
- 8) Information is set in *D* as follows:
  - The data type, precision, scale, and datetime data type of the item described by *IDA* are set to the values of Type, Precision, Scale, and SubType, respectively.

- b) Case:
  - i) If *D* is an implementation parameter descriptor, then the length (in characters or positions, as appropriate) of the item described by *IDA* is set to the value of Length.
  - ii) Otherwise, the length in octets of the item described by *IDA* is set to the value of Length.
- c) If StringLength is not a null pointer, then the address of the host variable that is to provide the length of the item described by *IDA*, or that is to receive the returned length in octets of the item described by *IDA*, is set to the address of StringLength.
- d) The address of the host variable that is to provide a value for the item described by *IDA*, or that is to receive a value for the item described by *IDA*, is set to the address of Data. If Data is a null pointer, then the address is set to 0 (zero).
- e) If Indicator is not a null pointer, then the address of the <indicator variable associated with the item described by *IDA* is set to the address of Indicator.
- 9) If Data is not a null pointer and *IDA* is not consistent as specified in Subclause 5.18, "Description of CLI item descriptor areas", then an exception condition is raised: *CLI-specific condition inconsistent descriptor information*.
- 10) If an exception condition is raised, then all fields of *IDA* for which specific values were provided in the invocation of SetDescRec are set to implementation-dependent values and the value of the COUNT field of *D* is unchanged.
- 11) Restrictions on the differences allowed between implementation and application parameter descriptors are implementation-defined, except as specified in the General Rules of Subclause 5.10, "Implicit EXECUTE USING and OPEN USING clauses", in the General Rules of Subclause 5.11, "Implicit CALL USING clause", and in the General Rules of Subclause 6.49, "ParamData". Restrictions on the differences between the implementation and application row descriptors are implementation-defined, except as specified in the General Rules of Subclause 5.13, "Implicit FETCH USING clause", and the General Rules of Subclause 6.30, "GetData".

**SQL/CLI routines 281** 

### 6.58 SetEnvAttr

### **Function**

Set the value of an SQL-environment attribute.

### **Definition**

```
SetEnvAttr (
    EnvironmentHandle
                         ΤN
                                    INTEGER,
    Attribute
                         IN
                                    INTEGER,
    Value
                         IN
                                    ANY,
    StringLength
                         IN
                                    INTEGER )
    RETURNS SMALLINT
```

### **General Rules**

- 1) Case:
- OF of 15011EC 9015-3:2016 If EnvironmentHandle does not identify an allocated SQL-environment or if it identifies an allocated skeleton SQL-environment, then an exception condition is raised: CLI-specific condition — invalid handle.
  - b) Otherwise:
    - Let *E* be the allocated SQL-environment identified by EnvironmentHandle. i)
    - ii) The diagnostics area associated with E is emptied.
- 2) If there are any allocated SQL-connections associated with E, then an exception condition is raised: CLIspecific condition — attribute connot be set now.
- 3) Let A be the value of Attribute.
- 4) If A is not one of the code values in Table 16, "Codes used for environment attributes", then an exception condition is raised: CLI-specific condition — invalid attribute identifier.
- 5) If A indicates NULL TERMINATION, then

Case:

- If Value indicates TRUE, then null termination for E is set to <u>True</u>.
- b) If Value indicates FALSE, then null termination for *E* is set to *False*.
- c) Otherwise, an exception condition is raised: *CLI-specific condition invalid attribute value*.
- 6) If A specifies an implementation-defined environment attribute, then

Case:

a) If the data type for the environment attribute is specified as INTEGER in Table 20, "Data types of attributes", then the environment attribute is set to the value of Value.

### b) Otherwise:

- Let SL be the value of StringLength. i)
- ii) Case:
  - 1) If SL is not negative, then let L be SL.
- 2) If SL indicates NULL TERMINATED, then let L be the number of octets of Value that ehar a—invalid

  a—invalid

  STANDARDS ISO.COM. Circle to view the full role of the control of the precede the implementation-defined null character that terminates a C character string.
  - 3) Otherwise, an exception condition is raised: *CLI-specific condition*—invalid string length

### 6.59 SetStmtAttr

### **Function**

Set the value of an SQL-statement attribute.

### **Definition**

```
SetStmtAttr (
StatementHandle IN INTEGER,
Attribute IN INTEGER,
Value IN ANY,
StringLength IN INTEGER)
RETURNS SMALLINT
```

## **General Rules**

- 1) Let S be the allocated SQL-statement identified by Statement Handle.
- 2) Let *A* be the value of Attribute.
- 3) If *A* is not one of the code values in Table 18, "Codes used for statement attributes", or if *A* is one of the code values in Table 18, "Codes used for statement attributes", but the row that contains *A* contains 'No' in the 'May be set' column, then an exception condition is raised: *CLI-specific condition invalid attribute identifier*.
- 4) Let *V* be the value of Value.
- 5) Case:
  - a) If A indicates APD\_HANDLE, then:
    - i) Case:
      - 1) If *V* does not identify an allocated CLI descriptor area, then an exception condition is raised: *CLI-specific condition invalid attribute value*.
      - 2) Otherwise, let *DA* be the CLI descriptor area identified by *V* and let *AT* be the value of the ALLOC\_TYPE field for *DA*.
    - ii) Case:
      - 1) If AT indicates AUTOMATIC but DA is not the application parameter descriptor associated with S, then an exception condition is raised: CLI-specific condition invalid use of automatically-allocated descriptor handle.
      - 2) Otherwise, DA becomes the current application parameter descriptor for S.
  - b) If *A* indicates ARD\_HANDLE, then:
    - i) Case:

- 1) If *V* does not identify an allocated CLI descriptor area, then an exception condition is raised: *CLI-specific condition invalid attribute value*.
- 2) Otherwise, let *DA* be the CLI descriptor area identified by *V* and let *AT* be the value of the ALLOC\_TYPE field for *DA*.
- ii) Case:
  - 1) If AT indicates AUTOMATIC but DA is not the application row descriptor associated with S, then an exception condition is raised: CLI-specific condition invalid use of automatically-allocated descriptor handle.
  - 2) Otherwise, DA becomes the current application row descriptor for S.
- c) If A indicates CURSOR SCROLLABLE, then

Case:

- i) If the implementation supports scrollable cursors, then:
  - 1) If an open CLI cursor is associated with *S*, then an exception condition is raised: *CLI-specific condition attribute cannot be set now*.
  - 2) Case:
    - A) If *V* indicates NONSCROLLABLE, then the CURSOR SCROLLABLE attribute of *S* is set to NONSCROLLABLE.
    - B) If *V* indicates SCROLLABLE, then the CURSOR SCROLLABLE attribute of *S* is set to SCROLLABLE.
    - C) Otherwise, an exception condition is raised: *CLI-specific condition invalid attribute value*.
- ii) Otherwise, an exception condition is raised: *CLI-specific condition* optional feature not implemented.
- d) If A indicates CURSOR SENSITIVITY, then

Case:

i) If the implementation supports cursor sensitivity, then

Case

If an open CLI cursor is associated with *S*, then an exception condition is raised: *CLI-specific condition* — *attribute cannot be set now*.

- 2) Case:
  - A) If *V* indicates ASENSITIVE, then the CURSOR SENSITIVITY attribute of *S* is set to ASENSITIVE.
  - B) If *V* indicates INSENSITIVE, then the CURSOR SENSITIVITY attribute of *S* is set to INSENSITIVE.
  - C) If *V* indicates SENSITIVE, then the CURSOR SENSITIVITY attribute of *S* is set to SENSITIVE.

# ISO/IEC 9075-3:2016(E) 6.59 SetStmtAttr

- D) Otherwise, an exception condition is raised: *CLI-specific condition invalid attribute value*.
- ii) Otherwise, an exception condition is raised: *CLI-specific condition optional feature not implemented*.
- e) If A indicates METADATA ID, then

#### Case:

- i) If V indicates FALSE, then the METADATA ID attribute of S is set to FALSE.
- ii) If V indicates TRUE, then the METADATA ID attribute of S is set to TRUE
- iii) Otherwise, an exception condition is raised: CLI-specific condition invalid attribute value
- f) If A indicates CURSOR HOLDABLE, then

### Case:

i) If the implementation supports cursor holdability, then

### Case:

- 1) If an open CLI cursor is associated with *S*, then an exception condition is raised: *CLI-specific condition attribute cannot be set now*.
- 2) Case:
  - A) If *V* indicates NONHOLDABLE, then the CURSOR HOLDABLE attribute of *S* is set to NONHOLDABLE.
  - B) If *V* indicates HOLDABLE, then the CURSOR HOLDABLE attribute of *S* is set to HOLDABLE.
  - C) Otherwise, an exception condition is raised: *CLI-specific condition invalid attribute*
- ii) Otherwise, an exception condition is raised: *CLI-specific condition* optional feature not implemented.
- g) If A indicates CURRENT OF POSITION, then

#### Case:

- i) If there is no open CLI cursor CR associated with S, then an exception condition is raised: CLI-specific condition Invalid cursor state.
- If V is greater than the ARRAY\_SIZE field of the application row descriptor associated with S, then an exception condition is raised: CLI-specific condition row value out of range.
  - iii) If the operational scrollability property of *CR* is not SCROLL, then an exception condition is raised: *CLI-specific condition invalid cursor position*.
- iv) Otherwise, the current row within the fetched rowset associated with S is set to V.
- h) If A indicates NEST DESCRIPTOR, then

Case:

- i) If there is a prepared statement associated with StatementHandle, then an exception condition is raised: *CLI-specific condition function sequence error*.
- ii) Otherwise,

### Case:

- 1) If V indicates FALSE, then the NEST DESCRIPTOR attribute of S is set to FALSE.
- 2) If V indicates TRUE, then the NEST DESCRIPTOR attribute of S is set to TRUE.
- 3) Otherwise, an exception condition is raised: *CLI-specific condition invalid attribute value*.
- 6) If A specifies an implementation-defined statement attribute, then

#### Case:

- a) If the data type for the statement attribute is specified as INTEGER in Table 20, "Data types of attributes", then the statement attribute is set to the value of Value.
- b) Otherwise:
  - i) Let SL be the value of StringLength.
  - ii) Case:
    - 1) If SL is not negative, then let L be SL
    - 2) If *SL* indicates NULL TERMINATED, then let *L* be the number of octets of Value that precede the implementation-defined null character that terminates a C character string.
    - 3) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length* or buffer length.
  - iii) The statement attribute is set to the first L octets of Value.

## **6.60 SpecialColumns**

### **Function**

Return a result set that contains a list of columns the combined values of which can uniquely identify any row within a single specified table described by the Information Schemas of the connected data source.

### **Definition**

```
SpecialColumns (
                         IN INTEGER,
   StatementHandle
   IdentifierType
                          IN SMALLINT,
   CatalogName
                           IN CHARACTER(L1),
   NameLength1
                           IN SMALLINT,
   SchemaName
                           IN CHARACTER(L2),
   NameLength2
                           IN SMALLINT,
   TableName
                           IN CHARACTER (L3),
   NameLength3
                           IN SMALLINT,
                           IN SMALLINT,
   Scope
                           IN SMALLINT )
   Nullable
   RETURNS SMALLINT
```

where each of L1, L2, and L3 has a maximum value equal to the implementation-defined maximum length of a variable-length character string.

### **General Rules**

- 1) Let S be the allocated SQL-statement identified by StatementHandle.
- 2) If an open CLI cursor is associated with S, then an exception condition is raised: *invalid cursor state*.
- 3) Let C be the allocated SQL-connection with which S is associated.
- 4) Let EC be the established SQL-connection associated with C and let SS be the SQL-server on that connection.
- Let SPECIAL\_COLUMNS\_QUERY be a table, with the definition:

```
CREATE TABLE SPECIAL_COLUMNS_QUERY (
   SCOPE
                       SMALLINT.
   COLUMN NAME
                        CHARACTER VARYING(128) NOT NULL,
   DATA_TYPE
                       SMALLINT NOT NULL,
   TYPE_NAME
                        CHARACTER VARYING(128) NOT NULL,
   COLUMN_SIZE
                        INTEGER,
   BUFFER_LENGTH
                         INTEGER,
   DECIMAL_DIGITS
                         SMALLINT,
   PSEUDO_COLUMN
                         SMALLINT )
```

6) SPECIAL COLUMNS OUERY contains a row for each column that is part of a set of columns that can be used to best uniquely identify a row within the tables listed in SS's Information Schema TABLES view. Some tables may not have such a set of columns. Some tables may have more than one such set, in which case it is implementation-dependent as to which set of columns is chosen. It is implementation-dependent as to whether a column identified for a given table is a pseudo-column.

- a) Let *SUP* be the value of Supported that is returned by the execution of GetFeatureInfo with FeatureType = 'FEATURE' and FeatureId = 'C041' (corresponding to the feature "Information Schema metadata constrained by privileges").
- b) Case:
  - i) If the value of *SUP* is 1 (one), then Table 29, "Codes and data types for implementation information", is 'Y', then *SPECIAL\_COLUMNS\_QUERY* contains a row for each identifying column in *SS*'s Information Schema COLUMNS view and each implementation-dependent pseudocolumn.
  - ii) Otherwise, *SPECIAL\_COLUMNS\_QUERY* contains a row for each identifying column in *SS*'s Information Schema COLUMNS view and each implementation-dependent pseudo-column in accordance with implementation-defined authorization criteria.
- 7) If the value of IdentifierType is other than the code for BEST ROWID in Table 39, "Column types and scopes used with SpecialColumns", or an implementation-defined extension to that table, then an exception condition is raised: *CLI-specific condition column type out of range*.
- 8) If the value of Scope is other than the code SCOPE CURRENT ROW, SCOPE TRANSACTION, or SCOPE SESSION in Table 39, "Column types and scopes used with SpecialColumns", or an implementation-defined extension to that table, then an exception condition is raised: *CLI-specific condition scope out of range*.
- 9) If the value of Nullable is other than the code for NO NULLS or NULLABLE in Table 39, "Column types and scopes used with SpecialColumns", then an exception condition is raised: *CLI-specific condition*—nullable type out of range.
- 10) For each row of SPECIAL COLUMNS QUERY:
  - a) The value of SCOPE in SPECIAL\_COLUMNS\_QUERY is either the code for one of SCOPE CURRENT ROW, SCOPE TRANSACTION, or SCOPE SESSION from Table 39, "Column types and scopes used with SpecialColumns", or it is an implementation-defined value, determined as follows:

### Case:

- i) If the value that uniquely identifies a row is only guaranteed to be valid while positioned on that row, then the code is that for SCOPE CURRENT ROW.
- ii) If the value that uniquely identifies a row is only guaranteed to be valid for the current transaction, then the code is that for SCOPE TRANSACTION.
- iii) If the value that uniquely identifies a row is only guaranteed to be valid for the current SQL-session, then the code is that for SCOPE SESSION.
- (v) Otherwise, the value is implementation-defined.
- b) The value of COLUMN\_NAME in *SPECIAL\_COLUMNS\_QUERY* is the value of the COLUMN NAME column in the COLUMNS view.
- c) The value of DATA\_TYPE in *SPECIAL\_COLUMNS\_QUERY* is derived from the values of the DATA\_TYPE and INTERVAL\_TYPE columns in the COLUMNS view as follows:

### Case:

i) If the value of DATA\_TYPE in the COLUMNS view is 'INTERVAL', then the value of DATA\_TYPE in *SPECIAL\_COLUMNS\_QUERY* is the appropriate Code from Table 33, "Codes

- used for concise data types", that matches the interval specified in the INTERVAL\_TYPE column in the COLUMNS view.
- ii) Otherwise, the value of DATA\_TYPE in *SPECIAL\_COLUMNS\_QUERY* is the appropriate Code from Table 33, "Codes used for concise data types", that matches the data type specified in the DATA\_TYPE column in the COLUMNS view.
- d) The value of TYPE\_NAME in SPECIAL\_COLUMNS\_QUERY is an implementation-defined value that is the character string by which the data type is known at the data source.
- e) The value of COLUMN\_SIZE in *SPECIAL\_COLUMNS\_QUERY* is Case:
  - i) If the value of DATA\_TYPE in the COLUMNS view is 'CHARACTER' CHARACTER VARYING', 'CHARACTER LARGE OBJECT', 'BINARY', 'BINARY VARYING', or 'BINARY LARGE OBJECT', then the value is that of the CHARACTER\_MAXIMUM\_LENGTH in the same row of the COLUMNS view.
  - ii) If the value of DATA\_TYPE in the COLUMNS view is 'DECIMAL' or 'NUMERIC', then the value is that of the NUMERIC\_PRECISION column in the same row of the COLUMNS view.
  - iii) If the value of DATA\_TYPE in the COLUMNS view is 'SMALLINT', 'INTEGER', 'BIGINT', 'FLOAT', 'DECFLOAT', 'REAL', or 'DOUBLE PRECISION', then the value is implementation-defined.
  - iv) If the value of DATA\_TYPE in the COLUMNS view is 'DATE', 'TIME', 'TIMESTAMP', 'TIME WITH TIME ZONE', or 'TIMESTAMP WITH TIME ZONE', then the value of COLUMN\_SIZE is that derived from SR 39), in Subclause 6.1, "<data type>", of [ISO9075-2], where the value of <time fractional seconds precision> is the value of the NUMERIC\_PRECISION column in the same row of the COLUMNS view.
  - v) If the value of DATA\_TYPE in the COLUMNS view is 'INTERVAL', then the value of COLUMN\_SIZE is that derived from the General Rules of Subclause 10.1, "<interval qualifier>", of [ISO9075-2], where:
    - 1) The value of interval qualifier> is the value of the INTERVAL\_TYPE column in the same row of the COLUMNS view.
    - 2) The value of <interval leading field precision> is the value of the INTERVAL\_PRECISION column in the same row of the COLUMNS view.
    - The value of <interval fractional seconds precision> is the value of the NUMERIC\_PRE-CISION column in the same row of the COLUMNS view.
    - If the value of DATA\_TYPE in the COLUMNS view is 'REF', then the value is the length in octets of the reference type.
  - vii) Otherwise, the value is implementation-dependent.
- f) The value of BUFFER LENGTH in SPECIAL COLUMNS QUERY is implementation-defined.
  - NOTE 55 The purpose of BUFFER\_LENGTH is to record the number of octets transferred for the column with a Fetch routine, a FetchScroll routine, or a GetData routine when the TYPE field in the application row descriptor indicates DEFAULT. This length excludes any null terminator.
- g) The value of DECIMAL\_DIGITS in SPECIAL\_COLUMNS\_QUERY is:

### Case:

- i) If the value of DATA\_TYPE in the COLUMNS view is one of 'DATE', 'TIME', 'TIMESTAMP', 'TIME WITH TIME ZONE', or 'TIMESTAMP WITH TIME ZONE', then the value of DECIMAL\_DIGITS in *SPECIAL\_COLUMNS\_QUERY* is the value of the DATETIME\_PRECISION column in the COLUMNS view.
- ii) If the value of DATA\_TYPE in the COLUMNS view is one of 'NUMERIC', 'DECIMAL', 'SMALLINT', 'INTEGER', or 'BIGINT', then the value of DECIMAL\_DIGITS in *SREOCIAL\_COLUMNS\_QUERY* is the value of the NUMERIC\_SCALE column in the COLUMNS view.
- iii) Otherwise, the value of DECIMAL\_DIGITS in SPECIAL\_COLUMNS\_QUERY is the null value.
- h) The value of PSEUDO\_COLUMN in *SPECIAL\_COLUMNS\_QUERY* is the code for one of PSEUDO UNKNOWN, NOT PSEUDO, or PSEUDO from Table 39, "Column types and scopes used with SpecialColumns". The algorithm used to set this value is implementation-dependent.
- 11) Let NL1, NL2, and NL3 be the values of NameLength1, NameLength2, and NameLength3, respectively.
- 12) Let *CATVAL*, *SCHVAL*, *TBLVAL*, *SCPVAL*, and *NULVAL* be the values of CatalogName, SchemaName, and TableName, Scope, and Nullable respectively.
- 13) If the METADATA ID attribute of *S* is TRUE, then:
  - a) If CatalogName is a null pointer and the value of the CATALOG NAME information type from Table 29, "Codes and data types for implementation information", is 'Y', then an exception condition is raised: *CLI-specific condition invalid use of null pointer*.
  - b) If SchemaName is a null pointer, then an exception condition is raised: *CLI-specific condition*—invalid use of null pointer.
- 14) If TableName is a null pointer, then an exception condition is raised: *CLI-specific condition invalid use of null pointer*.
- 15) If CatalogName is a null pointer, then *NL1* is set to zero. If SchemaName is a null pointer, then *NL2* is set to zero. If TableName is a null pointer, then *NL3* is set to zero.
- 16) Case:
  - a) If *NL1* is not negative, then let *L* be *NL1*.
  - b) If *NL1* indicates NULL TERMINATED, then let *L* be the number of octets of CatalogName that precede the implementation-defined null character that terminates a C character string.
  - c) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.

Let *CATVAL* be the first *L* octets of CatalogName.

- 17) Case:
  - a) If NL2 is not negative, then let L be NL2.
  - b) If *NL2* indicates NULL TERMINATED, then let *L* be the number of octets of SchemaName that precede the implementation-defined null character that terminates a C character string.

### ISO/IEC 9075-3:2016(E) 6.60 SpecialColumns

Otherwise, an exception condition is raised: CLI-specific condition — invalid string length or buffer length.

Let *SCHVAL* be the first *L* octets of SchemaName.

- 18) Case:
  - a) If *NL3* is not negative, then let *L* be *NL3*.
  - b) If NL3 indicates NULL TERMINATED, then let L be the number of octets of TableName that precede the implementation-defined null character that terminates a C character string.
  - c) Otherwise, an exception condition is raised: CLI-specific condition invalid string length or buffer length.

Let *TBLVAL* be the first *L* octets of TableName.

- 19) Case:
  - a) If the METADATA ID attribute of *S* is TRUE, then:
    - i) Case:
      - 1) If the value of *NL1* is zero, then let *CATSTR* be a zero-length string.
      - 2) Otherwise.

Case:

A) If SUBSTRING(TRIM('CATVAL') FROM 1 FOR 1) = '"' and if SUB-STRING(TRIM('CATVAL') FROM CHAR\_LENGTH(TRIM('CATVAL')) FOR 1) = '"', then let *TEMPSTR* be the value obtained from evaluating:

```
SUBSTRING(TRIM(CCATVAL') FROM 2
 FOR CHAR_LENGTH(TRIM('CATVAL')) - 2)
```

and let *CANSTR* be the character string:

```
TABLE CAT = 'TEMPSTR' AND
```

Otherwise, let *CATSTR* be the character string:

```
UPPER(TABLE_CAT) = UPPER('CATVAL') AND
```

- - If the value of *NL2* is zero, then let *SCHSTR* be a zero-length string.
  - Otherwise,

Case:

A) If SUBSTRING(TRIM('SCHVAL') FROM 1 FOR 1) = '"' and if SUB-STRING(TRIM('SCHVAL') FROM CHAR LENGTH(TRIM('SCHVAL')) FOR 1) = '"', then let *TEMPSTR* be the value obtained from evaluating:

```
SUBSTRING(TRIM('SCHVAL') FROM 2
  FOR CHAR_LENGTH(TRIM('SCHVAL')) - 2)
and let SCHSTR be the character string:
TABLE_SCHEM = 'TEMPSTR' AND
```

- iii)

1) If the value of *NL3* is zero, then let *TBLSTR* be a zero-length string.

2) Otherwise,

Case:

A) If A) If SUBSTRING(TRIM('TBLVAL') FROM 1 FOR 1) = '"' and if SUB-STRING(TRIM('TBLVAL') FROM CHAR\_LENGTH(TRIM('TBLVAL')) FOR 1) = '"', then let *TEMPSTR* be the value obtained from evaluating:

```
SUBSTRING(TRIM('TBLVAL') FROM 2
 FOR CHAR_LENGTH(TRIM('TBLVAL
```

and let TBLSTR be the character string:

```
TABLE_NAME = 'TEMPSTRY AND
```

B) Otherwise, let *TBLSTR* be the character string:

```
UPPER(TABLE_NAME) = UPPER('TBLVAL') AND
```

- b) Otherwise:
  - If the value of NLI is zero, then let CATSTR be a zero-length string; otherwise, let CATSTR be i) the character string:

```
CAT = 'CATVAL' AND
```

If the value of NL2 is zero, then let SCHSTR be a zero-length string; otherwise, let SCHSTR be the character string:

```
TABLE_SCHEM = 'SCHVAL' AND
```

If the value of NL3 is zero, then let TBLSTR be a zero-length string; otherwise, let TBLSTR be iii) the character string:

```
TABLE_NAME = 'TBLVAL' AND
```

20) Let the value of *SCPSTR* be the character string:

```
SCOPE >= SCPVAL
```

# ISO/IEC 9075-3:2016(E) 6.60 SpecialColumns

21) Let *PRED* be the result of evaluating:

```
CATSTR | | ' ' | | SCHSTR | | ' ' | | TBLSTR | | ' ' | | SCPSTR
```

- 22) Case:
  - a) If NULVAL is equal to the code for NO NULLS in Table 27, "Miscellaneous codes used in CLI", and any of the rows selected by the above query would describe a column for which the value of IS\_NULLABLE column in the COLUMNS view is 'YES', then let *STMT* be the character string:

```
SELECT *
FROM SPECIAL_COLUMNS_QUERY
WHERE 1 = 2 - select no rows
ORDER BY SCOPE
```

b) Otherwise, let *STMT* be the character string:

```
SELECT *
FROM SPECIAL_COLUMNS_QUERY
WHERE PRED
ORDER BY SCOPE
```

23) ExecDirect is implicitly invoked with S as the value of Statement-Handle, STMT as the value of Statement-Text, and the length of STMT as the value of TextLength.

Circle to view the statement-Text, and the length of STMT as the value of TextLength.

Circle to view the statement-Text, and the length of STMT as the value of TextLength.

### 6.61 StartTran

### **Function**

Explicitly start an SQL-transaction and set its characteristics.

### **Definition**

```
StartTran (
HandleType IN SMALLINT,
Handle IN INTEGER,
AccessMode IN INTEGER,
IsolationLevel IN INTEGER )
RETURNS SMALLINT
```

### **General Rules**

- 1) Let HT be the value of HandleType and let H be the value of Handle.
- 2) If HT is not one of the code values in Table 14, "Codes used for SQL/CLI handle types", then an exception condition is raised: CLI-specific condition invalid handle.
- 3) Case:
  - a) If HT indicates STATEMENT HANDLE, then

Case:

- i) If *H* does not identify an allocated SQL-statement, then an exception condition is raised: *CLI-specific condition invalid handle*.
- ii) Otherwise, an exception condition is raised: *CLI-specific condition invalid attribute identifier*.
- b) If HT indicates DESCRIPTOR HANDLE, then

Case:

- i) If H does not identify an allocated CLI descriptor area, then an exception condition is raised: CLI-specific condition invalid handle.
- ii) Otherwise, an exception condition is raised: *CLI-specific condition*—invalid attribute identifier.
- c) If HT indicates CONNECTION HANDLE, then

Case:

- i) If *H* does not identify an allocated SQL-connection, then an exception condition is raised: *CLI*-specific condition invalid handle.
- ii) Otherwise:
  - 1) Let C be the allocated SQL-connection identified by H.
  - 2) The diagnostics area associated with C is emptied.

# ISO/IEC 9075-3:2016(E) 6.61 StartTran

- 3) Case:
  - A) If there is no established SQL-connection associated with *C*, then an exception condition is raised: *connection exception connection does not exist*.
  - B) Otherwise, let EC be the established SQL-connection associated with C.
- 4) If C has an associated established SQL-connection that is active, then let L1 be a list containing EC; otherwise, let L1 be an empty list.
- d) If HT indicates ENVIRONMENT HANDLE, then

Case:

- i) If *H* does not identify an allocated SQL-environment or if it identifies an allocated SQL-environment that is a skeleton SQL-environment, then an exception condition is raised: *CLI-specific condition*—invalid handle.
- ii) Otherwise:
  - 1) Let E be the allocated SQL-environment identified by H.
  - 2) The diagnostics area associated with E is emptied.
  - 3) Let L be a list of the allocated SQL-connections associated with E. Let L1 be a list of the allocated SQL-connections in L that have an associated established SQL-connection that is active.
- 4) If an SQL-transaction is currently active on any of the SQL-connections contained in L1, then an exception condition is raised: *invalid transaction state*  $\rightarrow$  *ortive SQL-transaction*.
- 5) Let AM be the value for AccessMode. If AM is not one of the codes in Table 32, "Values for TRANSAC-TION ACCESS MODE with StartTran", then an exception condition is raised: CLI-specific condition—invalid attribute identifier.
- 6) Let *IL* be the value for IsolationLevel. If *IL* is not one of the codes in Table 31, "Values for TRANSACTION ISOLATION OPTION with Start Tran", then an exception condition is raised: *CLI-specific condition*—invalid attribute identifier.
- 7) Let TXN be the SQL-transaction that is started by this invocation of the StartTran routine.
- 8) If READ ONLY is specified by AM, then the access mode of TXN is set to read-only. If READ WRITE is specified by AM, then the access mode of TXN is set to read-write.
- 9) The isolation level of *TXN* is set to an implementation-defined isolation level that will not exhibit any of the phenomena that the isolation level indicated by *TIL* would not exhibit, as specified in Table 9, "SQL-transaction isolation levels and the three phenomena", in [ISO9075-2].
- 10) TXN is started in each SQL-connection contained in L1.

## 6.62 TablePrivileges

### **Function**

Return a result set that contains a list of the privileges held on the tables whose names adhere to the requested of 15011EC 9015-3:2016 pattern(s) within tables described by the Information Schemas of the connected data source.

### **Definition**

```
TablePrivileges (
                       IN
   StatementHandle
                               INTEGER,
                        IN
   CatalogName
                               CHARACTER(L1),
                        IN
   NameLength1
                               SMALLINT,
                     IN
IN
IN
   SchemaName
                               CHARACTER(L2),
   NameLength2
                               SMALLINT,
   NameLength3
RETURNS SMALLINT
                               CHARACTER(L3),
                               SMALLINT )
```

where each of L1, L2, and L3 has a maximum value equal to the implementation-defined maximum length of a variable-length character string.

### **General Rules**

- 1) Let S be the allocated SQL-statement identified by StatementHandle.
- If an open CLI cursor is associated with S, then an exception condition is raised: *invalid cursor state*.
- Let C be the allocated SQL-connection with which S is associated.
- Let EC be the established SQL-connection associated with C and let SS be the SQL-server on that connection.
- Let *TABLE\_PRIVILEGES\_QUERY* be a table, with the definition:

```
CREATE TABLE TABLE PRIVILEGES_QUERY (
TABLE_CAT CHARACTER VARYING(128),
TABLE_SCHEM CHARACTER VARYING(128) NOT NULL,
GRANTOR CHARACTER VARYING(128) NOT NULL,
GRANTEE CHARACTER VARYING(128) NOT NULL,
PRIVILEGE CHARACTER VARYING(128) NOT NULL,
LS_GRANTABLE CHARACTER VARYING(128) NOT NULL,
CHARACTER VARYING(128) NOT NULL,
CHARACTER VARYING(3) NOT NULL,
CHARACTER VARYING(3) NOT NULL)
```

- TABLE\_PRIVILEGES\_QUERY contains a row for each privilege in SS's Information Schema TABLE\_PRIVILEGES view where:
  - a) Let SUP be the value of Supported that is returned by the execution of GetFeatureInfo with FeatureType = 'FEATURE' and FeatureId = 'C041' (corresponding to the feature "Information Schema metadata constrained by privileges").
  - b) Case:

# ISO/IEC 9075-3:2016(E) 6.62 TablePrivileges

- i) If the value of *SUP* is 1 (one), then *TABLE\_PRIVILEGES\_QUERY* contains a row for each privilege in *SS*'s Information Schema TABLE\_PRIVILEGES view.
- ii) Otherwise, *TABLE\_PRIVILEGES\_QUERY* contains a row for each privilege in *SS*'s Information Schema TABLE\_PRIVILEGES view that meets implementation-defined authorization criteria.
- 7) For each row of TABLE PRIVILEGES OUERY:
  - a) If the implementation does not support catalog names, then TABLE\_CAT is the null value; otherwise, the value of TABLE\_CAT in *TABLE\_PRIVILEGES\_QUERY* is the value of the TABLE\_CATALOG column in the TABLE PRIVILEGES view in the Information Schema.
  - b) The value of TABLE\_SCHEM in *TABLE\_PRIVILEGES\_QUERY* is the value of the TABLE\_SCHEMA column in the TABLE\_PRIVILEGES view.
  - c) The value of TABLE\_NAME in *TABLE\_PRIVILEGES\_QUERY* is the value of the TABLE\_NAME column in the TABLE\_PRIVILEGES view.
  - d) The value of GRANTOR in *TABLE\_PRIVILEGES\_QUERY* is the value of the GRANTOR column in the TABLE\_PRIVILEGES view.
  - e) The value of GRANTEE in *TABLE\_PRIVILEGES\_QUERY* is the value of the GRANTEE column in the TABLE PRIVILEGES view.
  - f) The value of PRIVILEGE in *TABLE\_PRIVILEGES\_QUERY* is the value of the PRIVILEGE\_TYPE column in the TABLE\_PRIVILEGES view.
  - g) The value of IS\_GRANTABLE in *TABLE\_PRIVILEGES\_QUERY* is the value of the IS\_GRANTABLE column in the TABLE\_PRIVILEGES view.
  - h) The value of WITH\_HIERARCHY in TABLE\_PRIVILEGES\_QUERY is the value of the WITH\_HIERARCHY column in the TABLE\_PRIVILEGES veiw.
- 8) Let NL1, NL2, and NL3 be the values of NameLength1, NameLength2, and NameLength3, respectively.
- 9) Let *CATVAL*, *SCHVAL*, and *TBLVAL* be the values of CatalogName, SchemaName, and TableName, respectively.
- 10) If the METADATA ID attribute of *S* is TRUE, then:
  - a) If CatalogName is a null pointer and the value of the CATALOG NAME information type from Table 29, "Codes and data types for implementation information", is 'Y', then an exception condition is raised: CLI-specific condition invalid use of null pointer.
  - b) If SchemaName is a null pointer or if TableName is a null pointer, then an exception condition is raised: *CLI-specific condition invalid use of null pointer*.
- 11) If CatalogName is a null pointer, then *NL1* is set to zero. If SchemaName is a null pointer, then *NL2* is set to zero. If TableName is a null pointer, then *NL3* is set to zero.
- 12) Case:
  - a) If *NL1* is not negative, then let *L* be *NL1*.
  - b) If *NL1* indicates NULL TERMINATED, then let *L* be the number of octets of CatalogName that precede the implementation-defined null character that terminates a C character string.

c) Otherwise, an exception condition is raised: *CLI-specific condition* — *invalid string length or buffer length*.

Let *CATVAL* be the first *L* octets of CatalogName.

- 13) Case:
  - a) If *NL*2 is not negative, then let *L* be *NL*2.
  - b) If *NL2* indicates NULL TERMINATED, then let *L* be the number of octets of SchemaName that precede the implementation-defined null character that terminates a C character string.
  - c) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.

Let SCHVAL be the first L octets of SchemaName.

- 14) Case:
  - a) If *NL3* is not negative, then let *L* be *NL3*.
  - b) If *NL3* indicates NULL TERMINATED, then let *L* be the number of octets of TableName that precede the implementation-defined null character that terminates a Ccharacter string.
  - c) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.

Let *TBLVAL* be the first *L* octets of TableName.

- 15) Case:
  - a) If the METADATA ID attribute of S is TRUE, then:
    - i) Case:
      - 1) If the value of *NL1* is zero, then let *CATSTR* be a zero-length string.
      - 2) Otherwise:

Case

A) If SUBSTRING(TRIM('CATVAL') FROM 1 FOR 1) = '"' and if SUBSTRING(TRIM('CATVAL') FROM CHAR\_LENGTH(TRIM('CATVAL')) FOR 1)
= '"', then let TEMPSTR be the value obtained from evaluating:

```
SUBSTRING(TRIM('CATVAL') FROM 2
FOR CHAR_LENGTH(TRIM('CATVAL')) - 2)
```

and let *CATSTR* be the character string:

```
TABLE_CAT = 'TEMPSTR' AND
```

B) Otherwise, let *CATSTR* be the character string:

```
UPPER(TABLE_CAT) = UPPER('CATVAL') AND
```

- ii) Case:
  - 1) If the value of *NL2* is zero, then let *SCHSTR* be a zero-length string.

# ISO/IEC 9075-3:2016(E) 6.62 TablePrivileges

2) Otherwise:

Case:

A) If SUBSTRING(TRIM('SCHVAL') FROM 1 FOR 1) = '"' and if SUBSTRING(TRIM('SCHVAL') FROM CHAR\_LENGTH(TRIM('SCHVAL')) FOR 1) = '"', then let TEMPSTR be the value obtained from evaluating:

```
SUBSTRING(TRIM('SCHVAL') FROM 2
FOR CHAR_LENGTH(TRIM('SCHVAL')) - 2)
and let SCHSTR be the character string:

TABLE_SCHEM = 'TEMPSTR' AND
```

B) Otherwise, let *SCHSTR* be the character string:

```
UPPER(TABLE_SCHEM) = UPPER('SCHVAL') AND
```

- iii) Case:
  - 1) If the value of *NL3* is zero, then let *TBLSTR* be a zero-length string.
  - 2) Otherwise:

Case:

A) If SUBSTRING(TRIM('TBLVAL') FROM 1 FOR 1) = '"' and if SUBSTRING(TRIM('TBLVAL') FROM CHAR\_LENGTH(TRIM('TBLVAL')) FOR 1) = '"', then let TEMPSTR be the value obtained from evaluating:

SUBSTRING(TRIM('TBLVAL') FROM 2
FOR CHAR\_LENGTH(TRIM('TBLVAL')) - 2)

and let TBLSTR be the character string:

TABLE\_NAME = 'TEMPSTR' AND

B) Otherwise, let *TBLSTR* be the character string:

```
UPPER(TABLE_NAME) = UPPER('TBLVAL') AND
```

- b) Otherwise
  - Let SPC be the Code value from Table 29, "Codes and data types for implementation information", that corresponds to the Information Type SEARCH PATTERN ESCAPE in that same table.
  - ii) Let *ESC* be the value of InfoValue that is returned by the execution of GetInfo() with the value of InfoType set to *SPC*.
  - iii) If the value of *NL1* is zero, then let *CATSTR* be a zero-length string; otherwise, let *CATSTR* be the character string:

```
TABLE_CAT = 'CATVAL' AND
```

iv) If the value of *NL2* is zero, then let *SCHSTR* be a zero-length string; otherwise, let *SCHSTR* be the character string:

```
TABLE_SCHEM LIKE 'SCHVAL' ESCAPE 'ESC' AND
```

v) If the value of *NL3* is zero, then let *TBLSTR* be a zero-length string; otherwise, let *TBLSTR* be the character string:

```
TABLE_NAME LIKE 'TBLVAL' ESCAPE 'ESC' AND
```

16) Let *PRED* be the result of evaluating:

```
CATSTR | | ' ' | | SCHSTR | | ' ' | | TBLSTR | | ' ' | | 1=1
```

17) Let *STMT* be the character string:

```
SELECT *
FROM TABLE_PRIVILEGES_QUERY
WHERE PRED
ORDER BY TABLE_CAT, TABLE_SCHEM, TABLE_NAME, PRIVILEGE
```

18) ExecDirect is implicitly invoked with *S* as the value of Statement and le, *STMT* as the value of Statement Text, and the length of *STMT* as the value of TextLength.

Click to item the statement of the value of Statement and the length of *STMT* as the value of Statement Text, and the length of *STMT* as the value of Statement Text, and the length of *STMT* as the value of Statement Text, and the length of *STMT* as the value of Statement Text, and the length of *STMT* as the value of Statement Text, and the length of *STMT* as the value of TextLength.

STANDARD STATEMENT OF TEXTLE STATEMENT O

### 6.63 Tables

### **Function**

Based on the specified selection criteria, return a result set that contains information about tables described by the Information Schema of the connected data source.

### **Definition**

```
Tables (
                      IN
                               INTEGER,
   StatementHandle
   CatalogName
                        IN
                               CHARACTER(L1),
   NameLength1
                        IN
                               SMALLINT,
   SchemaName
                        IN
                               CHARACTER(L2),
                IN
IN
IN
IN
   NameLength2
                               SMALLINT,
   TableName
                               CHARACTER(L3),
   NameLength3
                               SMALLINT,
   TableType
                               CHARACTER(L4).
   NameLength4
                               SMALLINT )
   RETURNS SMALLINT
```

where each of L1, L2, L3, and L4 has a maximum value equal to the implementation-defined maximum length of a variable-length character string.

### **General Rules**

- 1) Let S be the allocated SQL-statement identified by StatementHandle.
- 2) If an open CLI cursor is associated with S, then an exception condition is raised: *invalid cursor state*.
- 3) Let C be the allocated SQL-connection with which S is associated.
- 4) Let EC be the established SQL-connection associated with C and let SS be the SQL-server on that connection.
- 5) Let TABLES\_QUERY be a table with the definition:

```
CREATE TABLE TABLES QUERY (
           TABLE TABLES_QUERY (
TABLE_CAT CHARACTER VARYING(128),
TABLE_SCHEM CHARACTER VARYING(128),
TABLE_NAME CHARACTER VARYING(128),
TABLE_TYPE CHARACTER VARYING(254),
REMARKS CHARACTER VARYING(254),
REF_GENERATION CHARACTER VARYING(128),
REF_GENERATION CHARACTER VARYING(254),
UDT_CAT CHARACTER VARYING(128),
UDT_SCHEM CHARACTER VARYING(128),
UDT_NAME CHARACTER VARYING(128),
UDT_NAME CHARACTER VARYING(128),
UDT_NAME CHARACTER VARYING(128),
UNITED TABLE CAT TABLE SCHEM TABLE NAME
                   UNIQUE (TABLE_CAT, TABLE_SCHEM, TABLE_NAME) )
```

6) TABLES\_QUERY contains a row for each table described by SS's Information Schema TABLES view where:

- a) Let *SUP* be the value of Supported that is returned by the execution of GetFeatureInfo with FeatureType = 'FEATURE' and FeatureId = 'C041' (corresponding to the feature "Information Schema metadata constrained by privileges").
- b) Case:
  - i) If the value of *SUP* is 1 (one), then *TABLES\_QUERY* contains a row for each row describing a table in *SS*'s Information Schema TABLES view for which the connected UserName has selection privileges.
  - ii) Otherwise, *TABLES\_QUERY* contains a row for each row describing a table in *SS's* Information Schema TABLES view that meets implementation-defined authorization criteria
- 7) The description of the table *TABLES\_QUERY* is:
  - a) The value of TABLE\_CAT in *TABLES\_QUERY* is the value of the TABLE\_CATALOG column in the TABLES view. If *SS* does not support catalog names, then TABLE\_CAT is set to the null value.
  - b) The value of TABLE\_SCHEM in *TABLES\_QUERY* is the value of the TABLE\_SCHEMA column in the TABLES view. The value of TABLE\_NAME in *TABLES\_QUERY* is the value of the TABLE NAME column in the TABLES view.
  - c) The value of TABLE\_TYPE in *TABLES\_QUERY* is determined by the values of the TABLE\_TYPE column in the TABLES view.

Case:

- i) If the value of TABLE\_TYPE in the TABLES view is 'VIEW', then Case:
  - 1) If the defined view is within the Information Schema itself, then the value of TABLE\_TYPE in *TABLES\_QUERY* is set to 'SYSTEM TABLE'.
  - 2) Otherwise, the value of TABLE TYPE in TABLES OUERY is set to 'VIEW'.
- ii) If the value of TABLE\_TYPE in the TABLES view is 'BASE TABLE', then the value of TABLE\_TYPE in TABLES\_QUERY is set to 'TABLE'.
- iii) If the value of TABLE\_TYPE in the TABLES view is 'GLOBAL TEMPORARY' or 'LOCAL TEMPORARY', then the value of TABLE\_TYPE in *TABLES\_QUERY* is set to that value.
- iv) Otherwise, the value of TABLE\_TYPE in *TABLES\_QUERY* is an implementation-defined value.
- d) The value of REMARKS in *TABLES\_QUERY* is an implementation-defined description of the table.
- e) The value of SELF\_REF\_COLUMN in *TABLES\_QUERY* is the value of the SELF\_REFERENC-ING COLUMN NAME column in the TABLES view.
- f) The value of REF\_GENERATION in *TABLES\_QUERY* is the value of the REFERENCE\_GENERATION column in the TABLES view.
- g) The value of UDT\_CAT in *TABLES\_QUERY* is the value of the USER\_DEFINED\_TYPE\_CATALOG column in the TABLES view.
- h) The value of UDT\_SCHEMA in *TABLES\_QUERY* is the value of the USER\_DEFINED\_TYPE\_SCHEMA column in the TABLES view.

# ISO/IEC 9075-3:2016(E) 6.63 Tables

- i) The value of UDT\_NAME in *TABLES\_QUERY* is the value of the USER\_DEFINED\_TYPE\_NAME column in the TABLES view.
- 8) Let *NL1*, *NL2*, *NL3*, and *NL4* be the values of NameLength1, NameLength2, NameLength3, and NameLength4, respectively.
- 9) Let *CATVAL*, *SCHVAL*, *TBLVAL*, and *TYPVAL* be the values of CatalogName, SchemaName, TableName, and TableType, respectively.
- 10) If the METADATA ID attribute of *S* is TRUE, then:
  - a) If CatalogName is a null pointer and the value of the CATALOG NAME information type from Table 29, "Codes and data types for implementation information", is 'Y', then an exception condition is raised: *CLI-specific condition invalid use of null pointer*.
  - b) If SchemaName is a null pointer or if TableName is a null pointer, then an exception condition is raised: *CLI-specific condition invalid use of null pointer*.
- 11) If CatalogName is a null pointer, then *NL1* is set to zero. If SchemaName is a null pointer, then *NL2* is set to zero. If TableName is a null pointer, then *NL3* is set to zero. If TableType is a null pointer, then *NL4* is set to zero.
- 12) Case:
  - a) If *NL1* is not negative, then let *L* be *NL1*.
  - b) If *NL1* indicates NULL TERMINATED, then let *L* be the number of octets of CatalogName that precede the implementation-defined null character that terminates a C character string.
  - c) Otherwise, an exception condition is raised. CLI-specific condition invalid string length or buffer length.

Let *CATVAL* be the first *L* octets of CatalogName.

### 13) Case:

- a) If NL2 is not negative, then let L be NL2.
- b) If *NL2* indicates NULL TERMINATED, then let *L* be the number of octets of SchemaName that precede the implementation-defined null character that terminates a C character string.
- c) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.

Let SCHVAL be the first L octets of SchemaName.

### 14) Case: \(\nabla\)

- a) If *NL3* is not negative, then let *L* be *NL3*.
- b) If *NL3* indicates NULL TERMINATED, then let *L* be the number of octets of TableName that precede the implementation-defined null character that terminates a C character string.
- c) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.

Let *TBLVAL* be the first *L* octets of TableName.

15) Case:

- a) If *NL4* is not negative, then let *L* be *NL4*.
- b) If *NL4* indicates NULL TERMINATED, then let *L* be the number of octets of TableType that precede the implementation-defined null character that terminates a C character string.
- c) Otherwise, an exception condition is raised: *CLI-specific condition invalid string length or buffer length*.

Let *TYPVAL* be the first *L* octets of ColumnName.

- 16) Case:
  - a) If the METADATA ID attribute of S is TRUE, then:
    - i) Case:
      - 1) If the value of *NL1* is zero, then let *CATSTR* be a zero-length string.
      - 2) Otherwise,

Case:

A) If SUBSTRING(TRIM('CATVAL') FROM 1 FOR 1) = '"' and if SUBSTRING(TRIM('CATVAL') FROM CHAR LENGTH(TRIM('CATVAL')) FOR 1) = '"', then let TEMPSTR be the value obtained from evaluating:

```
SUBSTRING ( TRIM('CATVAL') FROM 2
FOR CHAR_LENGTH ( TRIM('CATVAL') ) - 2 )
```

and let *CATSTR* be the character string:

```
TABLE_CAT = 'TEMPSTR' AND
```

B) Otherwise, let *CATSTR* be the character string:

```
UPPER(TABLE_CAT) = UPPER('CATVAL') AND
```

- ii) Case:
  - 1) If the value of *NL2* is zero, then let *SCHSTR* be a zero-length string.
  - Otherwise,

Case:

A) If SUBSTRING(TRIM('SCHVAL') FROM 1 FOR 1) = '"' and if SUBSTRING(TRIM('SCHVAL') FROM CHAR\_LENGTH(TRIM('SCHVAL')) FOR 1) = '"', then let TEMPSTR be the value obtained from evaluating:

```
SUBSTRING ( TRIM('SCHVAL') FROM 2 FOR CHAR_LENGTH ( TRIM('SCHVAL') ) - 2 )
```

and let *SCHSTR* be the character string:

```
TABLE_SCHEM = 'TEMPSTR' AND
```

B) Otherwise, let *SCHSTR* be the character string:

```
UPPER(TABLE_SCHEM) = UPPER('SCHVAL') AND
```

- iii) Case:
  - 1) If the value of *NL3* is zero, then let *TBLSTR* be a zero-length string.
  - 2) Otherwise,

Case:

A) If SUBSTRING(TRIM('TBLVAL') FROM 1 FOR 1) = '"' and if SUBSTRING(TRIM('TBLVAL') FROM CHAR\_LENGTH(TRIM('TBLVAL')) FOR 1) = '"', then let TEMPSTR be the value obtained from evaluating:

```
SUBSTRING ( TRIM('TBLVAL') FROM 2
FOR CHAR_LENGTH ( TRIM('TBLVAL') )
```

and let TBLSTR be the character string:

```
TABLE_NAME = 'TEMPSTR' AND
```

B) Otherwise, let *TBLSTR* be the character string

```
UPPER(TABLE_NAME) = UPPER('TBLVAL') AND
```

- b) Otherwise:
  - i) Let *SPC* be the Code value from Table 29, "Codes and data types for implementation information", that corresponds to the Information Type SEARCH PATTERN ESCAPE in that same table.
  - ii) Let *ESC* be the value of InfoValue that is returned by the execution of GetInfo() with the value of InfoType set to *SPC*.
  - iii) If the value of *NLL* is zero, then let *CATSTR* be a zero-length string; otherwise, let *CATSTR* be the character string:

```
TABLE_CAT = 'CATVAL' AND
```

iv) If the value of *NL2* is zero, then let *SCHSTR* be a zero-length string; otherwise, let *SCHSTR* be the character string:

```
TABLE_SCHEM LIKE 'SCHVAL' ESCAPE 'ESC' AND
```

If the value of *NL3* is zero, then let *TBLSTR* be a zero-length string; otherwise, let *TBLSTR* be the character string:

```
TABLE_NAME LIKE 'TBLVAL' ESCAPE 'ESC' AND
```

- 17) Case:
  - a) If the value of *NL4* is zero, then let *TYPSTR* be a zero-length string.
  - b) Otherwise,

i) TableType is a comma-separated list of one or more types of tables that are to be returned in the result set. Each value may optionally be enclosed within <quote> characters. The types are 'TABLE', 'VIEW', 'GLOBAL TEMPORARY', 'LOCAL TEMPORARY', and 'SYSTEM TABLE'.

NOTE 56 — These types are mutually exclusive; for instance, 'TABLE' includes only user-created base tables and 'SYSTEM TABLE' includes only views from the Information Schema. Implementation-defined types may also be specified.

- ii) Let N be the number of comma-separated values specified within TableType.
- iii) Let TT be the set of comma-separated values  $TT_i$ , 1 (one)  $\leq i \leq N$ , specified within Table Type.
- iv) TYPSTR is a string that is the predicate required to select the requested types of tables from TABLES\_QUERY:

```
TABLE_TYPE = '''' || TRIM(TT_1) || ''''' OR TABLE_TYPE = '''' || TRIM(TT_2) || ''''' OR ...
TABLE_TYPE = '''' || TRIM(TT_N) || '''''
```

18) Let *PRED* be the result of evaluating:

```
CATSTR | ' ' | SCHSTR | ' ' | TBLSTR | ' ' | TYPSTR | | ' ' | 1=1
```

- 19) Case:
  - a) If the value of *CATVAL* is the value in the 'Value' column for ALL CATALOGS in Table 38, "Special parameter values", and both *SCHVAL* and *TBLVAL* are zero-length strings, then let *STMT* be the character string:

```
SELECT DISTINCT TABLE_CAT,

CAST (NULL AS VARCHAR(128)),

CAST (NULL AS VARCHAR(128)),

CAST (NULL AS VARCHAR(254)),

CAST (NULL AS VARCHAR(254))

FROM TABLES_QUERY

ORDER BY TABLE_CAT
```

NOTE 57 — All ables qualify for selection and no privileges are required for access to the underlying TABLES view.

b) If the value of *SCHVAL* is the value in the 'Value' column for ALL SCHEMAS in Table 38, "Special parameter values", and both *CATVAL* and *TBLVAL* are zero-length strings, then let *STMT* be the character string:

```
SELECT DISTINCT CAST (NULL AS VARCHAR(128)),
TABLE_SCHEM,
CAST (NULL AS VARCHAR(128)),
CAST (NULL AS VARCHAR(254)),
CAST (NULL AS VARCHAR(254))
FROM TABLES_QUERY
ORDER BY TABLE_SCHEM
```

NOTE 58 — All tables qualify for selection and no privileges are required for access to the underlying TABLES view.

c) If the value of *TYPVAL* is the value in the 'Value' column for ALL TYPES in Table 38, "Special parameter values", and *CATVAL*, *SCHVAL*, and *TBLVAL* are zero-length strings, then let *STMT* be the character string:

### ISO/IEC 9075-3:2016(E) **6.63** Tables

```
SELECT DISTINCT CAST (NULL AS VARCHAR(128)),
                CAST (NULL AS VARCHAR(128)),
                CAST (NULL AS VARCHAR(128)),
                TABLE_TYPE,
                CAST (NULL AS VARCHAR(254))
FROM TABLES_QUERY
ORDER BY TABLE_TYPE
```

NOTE 59 — All tables qualify for selection and no privileges are required for access to the underlying TABLES view.

d) Otherwise, let *STMT* be the character string:

```
SELECT *
FROM TABLES_QUERY
WHERE PRED
ORDER BY TABLE_TYPE, TABLE_CAT, TABLE_SCHEM, TABLE_NAME
```
